re: 4650 Broadway / 2 Sherman Avenue, NYC

Dear Joe:

As per Paul Stayton's direction, enclosed please find a Phase I completed in February of 2003 for the above referenced property. Should you have any questions, please feel free to contact me directly at 212-398-8022.

Sincerely,

A handwritten signature in black ink, appearing to be 'SH', written over a light-colored background.

EXECUTIVE SUMMARY

The following is a summary of the findings obtained during the "Phase I" environmental site assessment conducted at the subject property located at 4650 Broadway and 2 Sherman Avenue, in the Borough of Manhattan, City and State of New York.

During the time of this assessment, the subject property consisted of a two-story commercial building (constructed in 1928) occupied by the New York City Human Resources Administration (NYCHRA) for office and public service purposes and a parking garage. The parking garage occupies the full basement and the southern portion of the first and second floors. The NYCHRA occupies the northern portion of the first and second floors. A boiler room is located at the southwestern portion of the basement.

Information obtained during the course of this assessment revealed that the NYC Department of Welfare and a garage occupied the site since the 1960s. The subject building was, reportedly, used for automobile sales and service purposes from the time of construction until at least the 1960s. Prior to construction of the existing building, the subject property, reportedly, consisted of undeveloped and/or vacant land.

A visual inspection of the boiler room revealed three (3) boiler units, numerous containers of waste oil, areas of oil-like staining, a 5,000-gallon fuel oil tank encased in concrete and situated within a concrete dike, an empty concrete containment dike (location of former fuel oil tanks), four (4) floor drains, and a sump pit and pump. One (1) floor drain located near the boiler units appeared to be subject to discharge of an oil-like substance.

A visual inspection of the parking garage facility revealed the following: numerous floor drains throughout the concrete floors, an access plate, three (3) inaccessible rooms (one reportedly an elevator motor room), and small areas of anti-freeze and oil stains within the basement; an office, restrooms, at least fourteen (14) floor drains, and a grease gun on the first floor; at least thirteen (13) floor drains and a storage room with automobile batteries on the second floor.

A visual inspection of the NYC Human Resources Administration office revealed the following: a "blower" room on the first floor with a concrete patch and two (2) compressed gas cylinders. This unit consisted primarily of open office space, public waiting rooms, private offices, and classrooms.

A visual inspection of the exterior portions of the subject property revealed a fill port and vent pipe associated with the 5,000-gallon fuel oil tank within the boiler room.

A review of surrounding property use revealed one (1) business, i.e., Henry's Cleaners, situated in close proximity to the subject property, which is known to us as being associated with the type of operation that historically represents a potential for adverse impact to the environment.

A review of historical Sanborn maps revealed two (2) gasoline tanks depicted near the entrance of the garage in 1994, 1988, 1986, 1985, 1980, 1979, and 1977.

Documentation at the Borough of Manhattan Building Department revealed permits for two (2) gasoline tanks, one installed in 1934 and the other in 1941. Further, this agency documents that one (1) 5,000-gallon and one (1) 2,500-gallon fuel tanks were removed from the site (filed in 1998) and replaced with one (1) 5,000-gallon fuel oil tank.

Documentation obtained from Hermont Operating Corp. indicated that three (3) 550-gallon underground gasoline tanks were abandoned (filled with concrete) at the site in 1988.

Information obtained from the NYC Fire Marshal indicated that one (1) 5,000-gallon and one (1) 2,500-gallon fuel oil tanks were registered at the subject property.

A review of the NYSDEC Underground Storage Tank (UST) Database revealed that one (1) 5,000-gallon and one (1) 2,500-gallon vaulted underground fuel oil tanks were closed/removed from the subject property on 9/1/98.

A review of the NYSDEC Aboveground Storage Tank (AST) Database revealed that one (1) 5,000-gallon aboveground fuel oil tank was installed at the site on 10/1/98. The tank is situated within a concrete dike on saddles, stilts, rack, or cradle. The tank was certified on 8/28/01 which expires on 12/30/06.

A review of federal and state information (obtained from the USEPA and NYSDEC) indicated there were no reported incidents concerning hazardous materials or wastes, major spills, or existing landfills at the subject property. The subject property was not listed as a NYSDEC Inactive Hazardous Waste Disposal Site, NPL (Superfund), or CERCLIS Site. The subject property did not appear within the NYSDEC Spill Sites Database, the NYSDEC Leaking Storage Tank Database or as an RCRA Small or Large Quantity Generator (SQG) Site.

The subject building currently utilizes fuel oil as an energy source for its heating units. Electricity is supplied to the subject property by Consolidated Edison (ConEd). The subject property is supplied potable water by the New York City Water Authority. The subject building is, reportedly, connected to the New York City Municipal Sewer System for the disposal of on-site sanitary wastes.

Based on the information obtained during the scope of this assessment, specific recommendations are cited within Section 12.6 of this report.

1.0 PURPOSE

The principal objectives of this "Phase I" environmental site assessment were to identify and evaluate current site conditions, the visual presence or absence of contamination, possible sources of contamination, and potential environmental impairments at the subject property. The assessment was limited to historical research and site reconnaissance to evaluate the existence of any such conditions.

Consistent with generally accepted protocols, the "Phase I" environmental site assessment did not include sampling or analysis of suspect materials (with the exception of that related to asbestos containing materials) which may have been observed on the subject property. The format of this assessment was predicated upon general guideline requirements established by individual lending institutions, American Society for Testing and Materials Standards (ASTM) (E1527-00 & 1528-00), various professional organizations, and our professional judgment.

1.1 Introduction

Soil Mechanics Environmental Services was retained by Mr. Steven Hornstock of Murray Hill Properties to perform a "Phase I" environmental site assessment at the referenced property. Reconnaissance of all accessible portions of the subject property and of any improvements was performed by Soil Mechanics personnel on December 23, 2002.

1.2 Site Location

The subject property is located at 4650 Broadway and 2 Sherman Avenue, north of Sherman Avenue, south of Dongan Place, and east of Fort Tryon Park, in the Borough of Manhattan, City and State of New York (see Project Location Plan - Figure #1). The subject property is currently designated as Block: 2176 and Lot: 1 at the Borough of Manhattan Tax Assessor's Office.

1.8 Scope of Work

Various items were identified during the scope of this investigation which included:

1. A thorough visual inspection ("walk-through") of the subject property.
2. A survey of the adjacent properties for current land use.
3. Review of historical aerial photographs and/or Sanborn Maps in order to identify past and present land usage at the subject property.
4. Review of ownership history (title search) in an attempt to identify previous owners who may have impacted the environmental quality of the subject property.
5. Review latest information from federal, state, and local agencies, regarding environmental concerns at the subject property and any surrounding sites.
6. Evaluation of various factors obtained during the investigation.

2.0 SITE HISTORY

The subject property currently consists of a two-story commercial building (constructed in 1928) occupied by the New York City Human Resources Administration for office and public service purposes and a parking garage. The subject building was, reportedly, used for automobile sales and service purposes from the time of construction until at least the 1960s. The City of New York has used the northern portion of the subject building for office purposes since at least the 1980s. Subsequent to the building's use as an automobile sales and service facility, the southern portion of the building has been utilized as a parking garage. Prior to construction of the existing building, the subject property, reportedly, consisted of vacant and/or undeveloped land.

2.1 EDR Sanborn - City Directory Abstract

The EDR-City Directory Abstract (obtained from EDR, Inc., 3639 Post Road, Southport, CT) is a historical search wherein business directories, including city, cross reference and telephone directories, are viewed-if available- at approximate five year intervals for the years spanning 1920 through 2000 (these years are not necessarily inclusive). Review of this information revealed that Packard Motor Car Company of NY occupied the subject property in 1934 (please refer to EDR-City Directory Abstract within Appendix).

2.2 Review of Historical Sanborn Maps

A review of historical Sanborn Maps (obtained from EDR Sanborn Inc., Southport, CT) dated 1893, 1900, 1913, 1935, 1950, 1966, 1969, 1977, 1978, 1980, 1981, 1983, 1985, 1986, 1988, 1989, 1991, 1992, 1994, and 1998, was conducted to identify past land usage at the subject property and surrounding area. A review of these Sanborn maps revealed the following (see attached select copies within Appendix):

1986 Sanborn Map

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1994 Sanborn Map

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. Two (2) gasoline tanks are depicted near the entrance to the garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1992, 1991, and 1989 Sanborn Maps

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1988, 1986, and 1985 Sanborn Maps

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. Two (2) gasoline tanks are depicted near the entrance to the garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1988 and 1981 Sanborn Maps

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1980, 1979, and 1977 Sanborn Maps

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. Two (2) gasoline tanks are depicted near the entrance to the garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1968 and 1968 Sanborn Maps

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1968 Sanborn Map

The subject property consisted of the existing two-story commercial building occupied by a garage and service facility. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1935 Sanborn Map

The area of the subject property is illegible on this map, therefore, property use is unknown. The surrounding land use consisted of multi-story apartment buildings and a used car lot to the north and multi-story apartment buildings to the east. Please note that property use to the south and west was not provided.

1913 Sanborn Map

The subject property consisted of vacant and/or undeveloped land. The surrounding land use consisted of vacant and/or undeveloped land, a dwelling, and Consolidated Gas Company with a gas holder to the north and vacant and/or undeveloped land and Consolidated Gas Company store house to the east. Please note that property use to the south and west was not provided.

02/21/2003 10:20 01/27/00 PAGE 10

1900 Sanborn Map

The subject property consisted of vacant and/or undeveloped land. The surrounding land use consisted of vacant and/or undeveloped land, a dwelling, and Consolidated Gas Company with a gas holder to the north and vacant and/or undeveloped land to the east. Please note that property use to the south and west was not provided.

1893 Sanborn Map

The subject property consisted of vacant and/or undeveloped land. The surrounding land use consisted of vacant and/or undeveloped land to the north, south, and east and two small unidentified structures to the west.

2.3 History of Ownership

A review of ownership records (title search) maintained at the Borough of Manhattan Tax Assessor's Office was conducted for the subject property in order to identify any former ownership that may have impacted the environmental quality of the subject property. Several of the names on record, i.e., automotive repair companies, are known to us as being associated with the types of operations that could have generated, manufactured, sold, or distributed hazardous materials or hazardous waste.

3.0 SITE DESCRIPTION

3.1 Facility Overview

During the time of this assessment, the subject property (approximately 40,000 square feet) consisted of a two-story commercial building with a full basement currently occupied by the New York City Human Resources Administration (4650 Broadway) for office and public service purposes and a parking garage (2 Sherman Avenue). The subject building occupies virtually the entire area of the site, which is surrounded by a concrete sidewalk and adjacent apartment buildings (see Site Plan Figures #2A-2D)(see attached photo-log within Appendix).

3.3 Visual Inspection (Interior)

A visual inspection of the interior portions of the subject building revealed it to be divided into two (2) commercial units: New York City Human Resources Administration (NYCHRA) and a parking garage. The NYCHRA occupies the first and second floors of the northern portion of the subject building. The parking garage occupies the full basement and the first and second floors of the southern portion of the subject building. The boiler room is also located in the basement, however, is only accessible from a first floor entrance door located along Sherman Avenue. The following specific items were identified:

New York City Human Resources Administration (4650 Broadway)

- The first and second floors of this unit consisted primarily of open office space, public waiting rooms, private offices, and classrooms. Several restroom facilities and storage rooms are located on the first and second floors. One of these storage rooms was observed to house a stop sink and cleaning materials for custodial services. No staining was visually identified on or around this sink. Further, a "blower" room was also located on the first floor. This room contained hot air blowers and ventilation systems, automatic sprinkler pipes, two (2) compressed gas cylinders, and a small circular concrete patch. This unit is serviced by an elevator located at the northwestern portion of the building.

Parking Garage (2 Sherman Avenue)

- The parking garage occupies the full basement (minus the boiler room) and the first and second floors of the southern portion of the subject building.

- The basement level consisted primarily of open parking space. Exit stairs are situated at the eastern and western sides of the garage. An inaccessible access plate was visually identified near the western exit stair. Numerous floor drains were observed throughout the concrete floor area. Also, three (3) inaccessible rooms were observed: one beneath the ramp to the first floor, one at the northwest corner and one at the northeast corner. Information obtained during this assessment indicates that

the room at the northwest corner of the basement is the elevator motor room. The contents of the remaining two rooms are unknown. Several small areas of oil and anti-freeze staining and pooling were observed at various locations. This condition is likely the result of incidental leakage and spillage from parked automobiles.

- The first floor of the parking garage consisted of a small office, restrooms, and an open parking area. At least fourteen (14) floor drains were observed in the concrete floor area. A grease gun was also observed attached to the ceiling within what appears to be a former service stall.

- The second floor of the parking garage consisted primarily of an open parking area. At least thirteen (13) floor drains were observed within the concrete floor area. A small room at the southeast corner was used for miscellaneous storage. Several automobile batteries were visually identified in this room.

Boiler Room

- The boiler room is located within an enclosed room in the basement accessible from a door along Sherman Avenue. Three (3) boiler units, a condensation tank, a slop sink, and four (4) floor drains were observed in the main boiler room. Oil-like staining was observed near a floor drain located in front of the boiler units. An absorbent material (i.e., Spendi-dry) had been applied to the stained area. Pits in front of two (2) of the boiler units were filled with sediment. As such, the presence of additional floor drains in these areas can not be discounted.

- A tank room with two (2) concrete containment dikes was located at the southern portion of the boiler room. One of these dikes was empty, however, evidence (i.e., concrete rubble, piping, oil-like staining) of a former heating oil tank was observed. A 5,000-gallon #4 fuel oil tank was located within the second containment dike. This tank was encased within a concrete vault. Oil-like staining was visually identified on the concrete vault and floor within this room.

- An electric room was located at the southeast corner of the boiler room. This room contained electric fuse boxes and switch boards.

A small room, located next to the electrical room, was observed to contain four (4) small containers of waste oil. Several additional waste oil containers were located along the eastern wall of the boiler room.

A concrete retaining wall separated the northern and southern sections of the boiler room. Plumbing and piping systems and a sump pit with associated pump were observed on the northern side of this wall. The sump pit was partially filled with water at the time of our inspection.

3.3 Visual Inspection (Exterior)

A visual inspection of exterior portions of the subject property revealed the following specific items:

- The north and eastern borders of the subject property abut adjacent multi-story apartment buildings.

- The western and southern portions of the subject building border a concrete sidewalk. A sub-grade electrical transformer vault and a fill port and vent pipe were visually identified within the concrete sidewalk outside the southern portion of the subject building. The fill port and vent pipe are likely associated with the 6,000-gallon #4 fuel oil tank within the boiler room.

4.0 VISUAL DISTURBANCES

During this inspection, the subject property revealed no visible evidence that could be attributed to major spills or discharges of hazardous materials or hazardous wastes.

All existing vegetation, on or about the subject property, appeared in good condition and showed no signs of unusual stress being placed upon it relative to the environmental conditions at the subject property.

6.0 SITE OPERATIONS AND UTILITIES

6.1 Electrical Transformer(s)

There were no pole and/or pad-mounted electrical transformers visually identified on or contiguous to the subject property. A sub-grade transformer vault was, however, visually identified within the concrete sidewalk outside the southern portion of the subject building.

6.2 Aboveground Storage Tank(s)

One (1) 5,000-gallon aboveground #4 fuel oil tank was visually identified within the boiler room. This tank was situated within a concrete containment dike and was encased in concrete. According to the NYSDEC Petroleum Bulk Storage (PBS) Database, this tank was installed at the site on 10/1/98. The tank is situated within a concrete dike on saddles, stilts, rack, or cradle. The tank was certified on 9/29/01 which expires on 12/30/06.

6.3 Underground Storage Tank(s)

During the time of our inspection, no evidence (i.e., fill ports, vent pipes) of any underground storage tanks (USTs) was visually identified at the subject property. Further, a response to our Record Search Request submitted to the NYS Fire Marshal indicated that there is no record of underground storage (gasoline) tanks at the subject property (4650 Broadway and 2 Sherman Avenue, Manhattan, NY).

6.4 Suspect/Former/Removed Underground Storage Tank(s)

A review of historical Sanborn maps revealed that two (2) gasoline tanks were located near the entrance to the garage in 1994, 1988, 1986, 1985, 1980, 1979, and 1977. Information obtained from the Borough of Manhattan Building Department indicated that two (2) gasoline tanks were installed at the subject property: one in 1934 and one in 1943. No information was obtained documenting the removal of any gasoline tanks. Documentation obtained from Belmont Operating Corp., however,

revealed that three (3) 550-gallon underground gasoline tanks were decommissioned by Gaservice Maintenance Corp. in January of 1983. According to the affidavit, all gasoline was removed and the tank filled with concrete along with all lines except vents. This affidavit and accompanying correspondence were submitted to the NYC Fire Marshal, however, no response documentation was available (see copies within Appendix).

Documentation obtained from the NYSDEC Petroleum Bulk Storage (PBS) Database, the New York City Fire marshal and the Manhattan Building Department revealed that one (1) 5,000-gallon and one (1) 2,500-gallon vaulted underground fuel oil tanks were closed/removed on 8/1/08. No other information was available. A visual inspection of the boiler room revealed evidence of former heating oil tank(s). The presence of an empty concrete dike, concrete rubble, piping systems, and oil-like staining all indicate that fuel oil tank(s) were formerly located in this area.

5.5 Utilities

The subject building currently utilizes fuel oil as an energy source for its heating units. Electricity is supplied to the subject property by Consolidated Edison (ConEd). The subject property is supplied potable water by the New York City Water Authority. The subject building is, reportedly, connected to the New York City Municipal Sewer System for the disposal of on-site sanitary wastes.

5.6 Hazardous Materials/Wastes Storage and Disposal

There are no current operations at the subject property involving the use and/or disposal of hazardous chemicals or hazardous waste. Various petroleum products were, however, stored within the subject building. These items included numerous small containers of waste oil identified within the boiler room.

6.7 Water Supply/Monitoring Well(s)

There was no visible evidence to indicate the presence of any groundwater monitoring and/or water supply wells throughout the subject property.

5.8 Interior Drainage Structure(s)

Numerous floor drains were visually identified at interior portions of the subject building. Four (4) were visually identified within the boiler room, at least thirteen within the second floor of the parking garage, at least fourteen (14) within the first floor of the parking garage, and numerous floor drains within the parking garage basement. No staining was observed in the vicinity of the floor drains within the parking garage. Oil-like staining was, however, observed near a floor drain located in front of the boiler units. The discharge point(s) of these drains is unknown. Please be advised that, due to numerous parked cars in the parking garage and sediments observed within pits in front of two (2) boiler units, these areas were not accessible for visual inspection. As such, additional floor drains may exist.

5.9 Exterior Drainage Structure(s)

There were no subsurface drainage structures (drywells, floor drains, trench drains, etc.) visually identified at exterior portions of the subject property.

6.0 SURROUNDING PROPERTY USE

Adjacent land use surrounding the subject property consisted of the following (see Figure #3 - Surrounding Land Use Map):

North of the site: Multi-story apartment buildings and Dongun Place.

South of the site: Fort Tryon Park, Broadway, and retail, commercial, and residential properties.

East of the site: Multi-story apartment buildings with retail on the first floor and Henry's Cleaners.

West of the site: Fort Tryon Park.

A review of surrounding property use revealed one (1) business, i.e., Henry's Cleaners, situated in close proximity to the subject property, which is known to us as being associated with the type of operation that historically represents a potential for adverse impact to the environment.

7.0 AGENCY CONTACT

A review of various documentation, from appropriate federal, state and local agencies, was conducted for the purpose of identifying any history of hazardous waste activity known to have occurred at the subject property or within a one mile radius. The standard environmental sources reviewed and approximate minimum search distances are pursuant to ASTM standards.

7.1 Federal Agencies

The National Priority List (NPL) is a list of properties with the highest priority for cleanup pursuant to the USEPA's Hazard Ranking System. The subject property was not listed as an NPL Site. There were no NPL Sites listed within a one mile radius of the subject property.

The Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) is a list of sites compiled by the USEPA that they have investigated or are currently investigating for potential hazardous substance contamination and possible inclusion on the NPL. The subject property did not appear on the CERCLIS listing report. There were no CERCLIS Sites identified within a one-half mile radius of the subject property.

CERCLIS-NFRAP Sites are CERCLIS Sites designated "No Further Remedial Action Planned" (NFRAP) and have been removed from CERCLIS. NFRAP Sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. The subject property was not listed as a CERCLIS-NFRAP Site.

The USEPA Emergency Response Notification System (ERNS) is a computer database containing information on release notifications of oil and hazardous substances that have occurred throughout the United States and have been reported to the National Response Center (NRC) and/or one of the 10 EPA Regions. The subject property did not appear within the ERNS database.

The USEPA Resource Conservation and Recovery Information System (RCRIS) includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). The subject property was not listed as a RCRA-Treatment, Storage, and/or Disposal (RCRA-TSD) Site. There were no RCRA-TSD Sites identified within a one mile radius.

A review of the Resource Conservation and Recovery Act (RCRA) Database did not reveal any Large and/or Small Quantity Generator Sites adjacent to the subject property. The subject property was not identified as a RCRA Large and/or Small Quantity Generator Site.

The Corrective Action Report (CORRACTS) is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally defined corrective action core events have occurred for every handler that has had corrective action activity. The subject property did not appear as a CORRACTS Site. There were no CORRACTS Sites identified within a one mile radius of the subject property.

7.2 State Agencies

The State Hazardous Waste Sites (SHWS) records are the States' equivalent to CERCLIS. These sites may or may not already be listed on the Federal CERCLIS list. Priority sites planned for cleanup using State funds (State equivalent of Superfund) are identified along with sites where cleanup will be paid for by potential responsible parties. The data comes from the Department of Environmental Conservation's Inactive Hazardous Waste Disposal Sites in New York State. There were no NYSDEC Inactive Hazardous Waste Disposal Sites listed at the subject property. There were no NYSDEC Inactive Hazardous Waste Disposal Site identified within a one mile radius of the subject property.

Solid Waste Facility/Landfill Site type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the State, these may be active or inactive facilities or open dumps that fail to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites. The subject property was not listed as a NYSDEC Solid Waste Facility/Landfill Site. There were no SWFLF Sites identified within a one-half mile radius of the subject property.

The Leaking Storage Tank (LTANK) Incident Report records contain an inventory of reported leaking storage tank incidents reported from April 1, 1986 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills. The subject property was not listed within the NYSDEC LTANK Database. A total of forty-one (41) LTANK Sites, however, have been identified within a one-half mile radius of the subject property, twenty-seven (27) of which have been documented as "closed" or "inactive" meaning that the spill has been cleaned up, all paper work completed and no further action is required by the NYSDEC. The remaining fourteen (14) sites, however, have been documented as

"active" meaning the spill investigations are ongoing. Please refer to Appendix for complete listing of NYSDEC LTANK Sites.

The Spills (SPILLS) Information Database includes spills active as of April 1, 1986, as well as spills occurring since that date. There were no NYSDEC Spill Sites identified at the subject property. A total of ninety-five (95) SPILL Sites were, however, identified within a one-half mile radius of the subject property. Fifty-five (55) of these Spill Sites have been documented as "closed" or "inactive" meaning that the spill has been cleaned up, all paper work completed and no further action is required by the NYSDEC. The remaining forty (40) sites, however, have been documented as "open" or "active" meaning the spill investigations are ongoing. Please refer to Appendix for complete listing of NYSDEC SPILL Sites.

The Underground Storage Tank (UST) Database contains registered UST's. UST's are regulated under Subtitle 3 of the Resource Conservation and Recovery Act (RCRA). The data comes from the Department of Conservation's Petroleum Bulk Storage (PBS) Database. The PBS Database lists facilities that have petroleum storage capacities in excess of 1,100 gallons and less than 400,000 gallons. The following PBS listing was identified at the subject property:

1) **Bermont Operating Corp.** - located at 2 Sherman Avenue (PBS # 2-077566). According to the PBS report, one (1) 5,000-gallon and one (1) 2,500-gallon vaulted underground fuel oil tanks were closed/removed on 9/1/88. Notably, no NYSDEC LTANK and/or Spill Sites were documented at the subject property.

The following Underground Storage Tank (UST) Sites were identified adjacent to the subject property:

1) **13 Dongan Place** - located just to the north of the subject property. According to the PBS report, one (1) 9,500-gallon underground fuel oil tank is located at this facility. This site was not listed as a NYSDEC LTANK and/or Spill Site.

2) 10 Dongan Place -- located just to the northeast of the subject property. According to the PBS report, one (1) 5,000-gallon vaulted underground fuel oil tank is located at this facility. No NYSDEC LTANK and/or Spill Sites were identified at this site.

NYSDEC AST List - Registered Aboveground Storage Tank (AST) List - this database contains listings of registered AST's. The data is provided by the NYSDEC Petroleum Bulk Storage (PBS) Database. The following NYSDEC Registered Aboveground Storage Tank (AST) was identified at the subject property:

1) **Bermont Operating Corp.** - located at 2 Sherman Avenue. According to the PBS report, one (1) 5,000-gallon aboveground fuel oil tank was installed at the site on 10/1/98. The tank is situated within a concrete dike on saddles, stilts, rack, or cradle. The tank was certified on 2/28/01 which expires on 12/30/06. Notably, no NYSDEC LTANK and/or Spill Sites were documented at the subject property.

The following NYSDEC Registered AST Sites were identified as adjoining the subject property:

1) **9-21 Sherman Avenue** - located just to the east-southeast of the subject property. According to the PBS report, one (1) 5,000-gallon fuel oil tank with asphalt coating is located at this facility. No NYSDEC LTANK and/or Spill Sites are documented at this site.

2) **Broadway & Ellwood Realty LLC** - located just to the south-southwest of the subject property at 646-48 Broadway. According to the PBS report, one (1) 5,000-gallon fuel oil tank with an epoxy liner and jacket is located at this facility. No NYSDEC LTANK and/or Spill Sites are documented at this site.

3) **20 Sherman Avenue** - located just to the east of the subject property. According to the PBS report, one (1) 5,000-gallon fuel oil tank with asphalt coating and situated within a concrete dike is located at this facility. No NYSDEC LTANK and/or Spill Sites are documented at this site.

4) 4672 Broadway - located just to the north-northwest of the subject property. According to the PBS report, one (1) 5,000-gallon fuel oil tank is located at this facility. No NYSDEC LTANK and/or Spill Sites are documented at this site.

7.8 Local Agencies

Record search request forms were submitted to the New York City Fire Department, Bureau of Fire Prevention in order to review any information they may have with respect to heating tanks and/or underground storage (gasoline) tanks at the subject property. A response from the NYC Fire Marshal indicated that they have no records of underground storage (gasoline) tanks at the subject property (4650 Broadway and 2 Sherman Avenue, Manhattan, NY).

Information pertaining to heating oil tanks revealed that one (1) 5,000-gallon and one (1) 2,500-gallon #4 fuel oil tanks are registered at 4650 Broadway. The permit, however, expired on 5/31/02 (see responses within Appendix).

Documentation from the Borough of Manhattan Building Department was obtained from the New York City web site (www.nyc.gov) in order to identify violations and/or information of environmental concern. Several building violations were listed, however, are related to structural issues, therefore, they are not included in this assessment. The following environmentally pertinent information was available (see copies within Appendix):

- A building permit (NB 149-26) was issued for the subject property on 7/6/26.
- A plumbing permit (P 1061-26) was also issued in 1926.
- An oil burner application (FO 900-87) was filed on 8/31/87.
- Two (2) gas tank permits (GT 126-34 & GT 283-41) were issued, one in 1934 and one in 1941.
- A violation filed on 8/11/64, indicating that a mercury gas test was performed on existing gas distribution piping system to obtain Cor Ed turn on for existing boiler pilot. An inspection was conducted and no further action was required.

- An alteration, filed on 4/27/99, to replace one (1) new 5,000-gallon fuel oil tank wrapped in 4" concrete block and remove existing 5,000-gallon and 2,500-gallon fuel oil tanks.

8.0 HYDROGEOLOGIC INFORMATION

Information obtained from the 7.5 minute series, Central Park, NY Quadrangle, published by the US Department of the Interior, Geological Survey topographic map revealed the subject property is located approximately forty to fifty (40-50) feet above sea level (see Topographic Map - Figure #4).

Information concerning depth to ground water and detailed local groundwater flow direction is not readily available. However, based upon local topography and the property's proximity to the Harlem River, it is our opinion that the local ground water flow component in this area is trending to the east-northeast.

9.0 RADON POTENTIAL

According to the State of New York Department of Health's publication, Indoor Radon In New York State: Distribution, Sources, and Controls, "Westchester County south of the Hudson Highlands, and Manhattan and Staten Islands are part of the southernmost extension of the New England Upland called the Manhattan Prong. Igneous and metamorphosed sedimentary rocks dominate the region. On Staten Island and in the Triassic Lowland Province in Rockland County is a prominent igneous intrusive rock, the Palisades diabase. The remainder of the Triassic Lowland is underlain by red sedimentary rocks of shale, sandstone, and conglomerate derived from the bordering highlands and deposited by fast moving streams. On the basis solely of existing indoor radon screening results, we surmise that the area southeast of the Hudson Highlands possesses little indoor radon potential."

10.0 ASBESTOS INSPECTION

An inspection of the subject facility was conducted by Testing Mechanics Corp. for the presence of friable asbestos-containing materials (ACM). The results of this investigation revealed the presence of friable ACM at various locations within the subject building. Please refer to Report of Phase I Asbestos Inspection within the Appendix for a full description of type and locations of friable ACM.

11.0 SUMMARY OF FINDINGS

• During the time of this assessment, the subject property consisted of a two-story commercial building (constructed in 1926) occupied by the New York City Human Resources Administration (NYCHRA) for office, public service, and parking. Information obtained during this assessment revealed that the NYC Department of Welfare and a garage occupied the site since the 1960s. The subject building was, reportedly, used for automobile sales and service purposes from the time of construction until at least the 1960s. Prior to construction of the existing building, the subject property, reportedly, consisted of undeveloped and/or vacant land.

• A visual inspection of the boiler room revealed three (3) boiler units, numerous containers of waste oil, areas of oil-like staining on the concrete floor, a 5,000-gallon fuel oil tank encased in concrete and situated within a concrete dike, an empty concrete containment dike (location of former fuel oil tanks), four (4) floor drains, and a sump pit and pump. One (1) floor drain located near the boiler units appeared to be subject to discharge of an oil-like substance.

• A visual inspection of the parking garage facility revealed the following: numerous floor drains throughout the concrete floors, an access plate, three (3) inaccessible rooms (one reportedly an elevator motor room), and small areas of anti-freeze and oil stains on the concrete floors within the basement; an office, restrooms, at least fourteen (14) floor drains, and a grease gun on the first floor; and at least thirteen (13) floor drains and a storage room with automobile batteries on the second floor.

- A visual inspection of the NYC Human Resources Administration office revealed the following: a "blower" room on the first floor with a concrete patch and two (2) compressed gas cylinders. This unit consisted primarily of open office space, public waiting rooms, private offices, and classrooms.

- A visual inspection of the exterior portions of the subject property revealed a fill port and vent pipe associated with the 5,000-gallon fuel oil tank located within the boiler room.

- A review of surrounding property use revealed one (1) business, i.e., Henry's Cleaners, situated in close proximity to the subject property, which is known to us as being associated with the type of operation that historically represents a potential for adverse impact to the environment.

- A review of historical Sanborn maps revealed two (2) gasoline tanks depicted near the entrance of the garage in 1994, 1988, 1986, 1985, 1980, 1979, and 1977.

- Documentation obtained at the Borough of Manhattan Building Department revealed permits for two (2) gasoline tanks, one installed in 1934 and the other in 1941. Further, this agency documents that one (1) 5,000-gallon and one (1) 2,500-gallon fuel tanks were removed from the site (filed in 1999) and replaced with one (1) 5,000-gallon fuel oil tank.

- Information obtained from Bermont Operating Corp. indicated that three (3) 550-gallon underground gasolines tanks were abandoned (filled with concrete) at the site in 1988. There was no regulatory documentation, however, to indicate this.

- Information obtained from the NYC Fire Marshal indicated that one (1) 5,000-gallon and one (1) 2,500-gallon fuel oil tanks were registered at the subject property.

A review of the NYSDEC Underground Storage Tank (UST) Database revealed that one (1) 5,000-gallon and one (1) 2,500-gallon vaulted underground fuel oil tanks were closed/removed from the subject property on 9/1/98.

A review of the NYSDEC Aboveground Storage Tank (AST) Database revealed that one (1) 5,000-gallon aboveground fuel oil tank was installed at the site on 10/1/98. The tank is situated within a concrete dike on saddles, stilts, rack, or cradle. The tank was certified on 8/28/01 which expires on 12/30/05.

- A review of the NYSDEC LTANK and Spill Sites Databases revealed fifty-four (54) "active" status spills within a one-half mile radius of the subject property.

- A review of the NYSDEC Petroleum Bulk Storage (PBS) Registration Database revealed two (2) UST Sites (12 & 19 Dongan Place) and three (3) AST Sites (0-21 Sherman Avenue, Broadway & Ellwood Realty LLC, 20 Sherman Avenue, and 4872 Broadway) listed as adjacent to the subject property. No NYSDEC LTANK and/or Spill Sites were listed at any of these facilities.

12.0 DISCUSSIONS, CONCLUSIONS AND RECOMMENDATIONS

In our opinion, based upon the scope of this investigation conducted at the site, which included a thorough visual investigation of the subject property, a survey of adjacent land use, examination of publicly available records, review of historical Sanborn maps, title search records and an evaluation of these factors, the following specific items are cited:

1) With respect to historical uses of the subject property (i.e., automobile sales and service/garage) and suspect/former underground storage tanks, it is our opinion that an appropriate Phase II investigation is warranted. This investigation should include, at a minimum, a geophysical survey to investigate the presence/absence of underground storage tanks depicted in historical Sanborn maps, an assessment of on-site soil quality in the vicinity of the abandoned 550-gallon underground gasoline tanks, and a trace dye analysis of interior floor drains to confirm their final discharge point(s). Pending completion of this assessment, additional investigations and/or remediation may be warranted. We further recommend all on-site underground storage tanks be properly registered and decommissioned as per 6 NYCRR Parts 612-614 and 40 CFR Part 280, if necessary.

2) Storage of small containers of waste oil was observed within the boiler room and automobile batteries were stored within a second story room in the parking garage. We recommend that these items be stored in an appropriate manner with secondary containment capabilities in compliance with the appropriate regulatory guidelines. Further, oil-like and anti-freeze-like staining were observed at various locations in the boiler room and parking garage. This appears to be a result of "sloppy housekeeping" procedures and/or incidental discharges from parked automobiles. We recommend that these areas be cleaned and the generated waste properly disposed of. We further recommend increased diligence in housekeeping procedures with respect to incidental spill prevention and clean up.

3) We recommend that the compressed gas cylinders, identified in a "blower" room in the NYCHRA offices, be stored in a designated secure location in accordance with appropriate regulatory guidelines.

4) With respect to surrounding land use of potential environmental concern, i.e., Henry's Cleaners, this site appears to be positioned at a hydrodynamically down gradient position in relation to the subject property. Further, no NYSDEC LTANK and/or Spill Sites have been documented at this facility. Based on this information, it is our opinion that this site does not represent a significant threat to the groundwater quality beneath the project site.

5) A total of fifty-four (54) "active" status NYSDEC LTANK and Spill Sites have been identified within a one-half mile radius of the subject property. Of these, fifty-three (53) appear to be situated hydrodynamically down and/or cross gradient from the subject property. Therefore, based on this information and their relative distances from the subject property, it is our opinion that these sites do not pose a significant threat to the environmental quality at the subject property.

The remaining "active" status spill appears to be situated hydrodynamically up gradient from the subject property. According to the spill report, however, the groundwater was not affected. Further, this spill is under the jurisdiction of the NYSDEC. Based on this information and on its relative distance from the subject property, it is our opinion that no action is warranted at the present time.

6) With respect to the five (5) NYSDEC Petroleum Bulk Storage (PBS) sites identified adjacent to the subject property, no NYSDEC LTANK and/or Spill Sites have been documented at these facilities. Based on this information, it is our opinion that no action is required regarding this matter at the present time.

1. Introduction

At the Request of Acadia Study Trust, CNS Management, Inc. ("CNS") conducted an asbestos survey at 4650 Broadway in New York City, New York. The purpose of the survey was to identify asbestos-containing materials ("ACM") throughout the building that might be impacted in future renovation work. The work was conducted in accordance with New York City Department of Environmental Protection regulations and the United States Environmental Protection Agency guidelines.

Tenants within the building consist of Ideal Parking Corp. (107,315 square feet) and the New York City Department of Human Resources Administration "Dyckman Job Center" (88,252 square feet). Common building materials were identified within the built out spaces consisting of cove base molding, wall board partitions and acoustical ceiling tile systems. At the time of the survey a copy of analytical results from a survey completed by Anthony Genaro, PE on February 19, 2004 was given to CNS, therefore the materials identified within the table was not sampled by CNS.

The building was constructed in 1928, which indicates that ACM may be present. The United States Environmental Protection Agency (EPA) started to impose bans on asbestos products from 1973 to 1978. The first ban of asbestos was in 1973 for the use of asbestos in spray-on fire proofing and thermal insulations. In 1979 the EPA announced its intention to issue a rule that bans all uses of asbestos. In 1989 the EPA institutes a "phase-down" ban of all asbestos containing materials, which banned the importing and use of asbestos materials into the United States, and allowed contractors to utilize any asbestos materials in stock without ordering or acquiring any new materials. The ban now states after a ruling in 1991 from the 5th Circuit Court that asbestos containing materials can be used in materials that were in existence prior to the 1989 ban, as long as they are in a non-friable form.

Certain friable materials, such as ceiling tiles are very likely to have been changed out several times since the construction of the building. Therefore, the materials present today are unlikely to contain asbestos. Roofing, floor tile and its mastic, on the other hand, are less likely to have been removed. Instead, these materials are commonly covered over with carpet or with another layer of tile. So identifying and sampling floor covering was a primary, but not exclusive, focus of this investigation. The survey also attempted to identify all friable forms of ACM, which is usually associated with heating systems and with fireproofing, such as spray-applied fireproofing.

2. Methods and Materials

Samples of suspect materials were collected in accordance with the United States Environmental Protection Agency's "Guide for Controlling Asbestos Materials in Buildings" (Purple Book, 550/6-85-024, June 1985) and EPA Asbestos in Buildings "Simplified Sampling Scheme for Surfacing Materials" (Pink Book, 1985, 560/5-85-030A). A detailed description of the sampling methodology employed follows.

Suspect materials were noted, along with their description and quantity. Inspections were made above ceiling tiles in key areas to check for piping with thermal insulation. The suspect materials, found in each room or area, were then grouped by homogeneous materials. They were deemed homogeneous if color, date of application, location and texture were judged to be identical. A sufficient number of samples were then collected from each homogeneous material to make a definitive determination of its asbestos content.

The number of samples collected from each homogeneous area is based on the type of material and size of the sampled area. At least three bulk samples are collected from each homogeneous surfacing material, or thermal system insulation. The number of samples of non-friable miscellaneous materials is left up to the discretion of the investigator, as outlined in AHERA (40 CFR Part 763, Subpart E). In some cases, samples of a suspect material were not taken because no hidden areas could be found, or where the quantity of suspect material was less than 100 square feet.

Bulk samples were then transported to ATC Associates (NVLAP License #101187 and ELAP License #10879), which is located at 104 East 23rd Street in New York City, New York, under chain of custody. Samples were analyzed by phase light microscopy ("PLM") via Method 40 CFR 763, Subpart F, Appendix A and EPA Method 600/M-4-82-020, and ELAP Analysis Protocol 198.1/198.4. Since PLM analysis of non-friable organically bound ("NOB") materials, is not consistently reliable for a negative determination of the presence of asbestos, all NOB samples that were negative under PLM analysis were then subjected to transmission electron microscopy ("TEM"). TEM analysis was conducted via EPA Method 600/R-23/116.

3. Results

The survey was conducted on January 21, 2005, at the time of the survey a copy of analytical results from a survey completed by Anthony Cimaro, PE on February 19, 2004 was given to CNS. Suspect materials are listed in the table below, along with quantity and analysis results. Materials that were sampled by others are also listed in the table. A sketch of the survey area that indicates the names and locations of the areas described in the table is also attached.

Survey Results Summary Table

Material	Location	Quantity (lb)	No. of Samples/ Content % Chrysotile
Window Gaskets/ Caulk	1 st Floor	--	1/ND ⁽¹⁾
Wall Plaster	2 nd Floor - Office Area	--	3/ND
Black Weatherproofing (Black)	2 nd Floor Parking Garage	--	3/ND
Coating Tower Fill	Roof	192	3/12
Gutz and Wall Fill		1,500	5/55
Asphalt Roof Membrane/Flashing		65,150	4/12
Suspect Materials sampled by Anthony Cimaro, PE:			
2' x 4' Ceiling tile	1 st and 2 nd floors - Office Areas	85,952	ND
Pipe Insulation	1 st Floor	--	Positive ⁽²⁾
White 12" x 12" VFT ⁽³⁾	1 st Floor	44,326	ND
Sheetrock	1 st Floor	--	ND
Brown 8" x 8" VFT	1 st and 2 nd floors - Office Areas	85,352	Positive
Spray-on Fireproofing	1 st Floor MEER	1,264	Positive

Note:

- (1) ND = None Detected.
- (2) VFT = Vinyl Fluoride Tile.
- (3) Number of Samples and Asbestos Content are expressed in this table (in parentheses) by error.

4. Site Description - Specific

4650 Broadway is a two-story commercial office building with a basement. The building is constructed primarily with a cement foundation, beams and columns. The facade consists of brick and stone with steel casement windows with non-asbestos containing glazing and caulking. The roof consists of asbestos containing asphalt sheathing (3" thick) and asbestos containing air which is trawled onto deck work, bulkheads and parapet walls. There is two Air Handling Units with associated ductwork that has asbestos containing but trawled only its surfaces. Enclosed within a two-foot brick wall, within the center of the roof area, there are three Marley cooling towers, with asbestos containing fill and drift eliminator, and asbestos containing pipe insulation, associated with the air conditioning system for the building. See Drawing # AS 3 within Appendix Section A.

The New York City Department of Human Resources Administration (Dyckman Job Center) occupies a total of 88,252 square feet of office space on the first and second floors. Building materials observed consisted of an acoustical ceiling tile system with 2' x 4' ceiling tiles. Interior partitions consisted of wallboard and metal demised one-foot above the drop ceiling. As noted, the structural decking, beams and columns consisted of cement with exception to a 4,264 square foot section on the south side of the first floor, observed within the mechanical equipment room, where asbestos containing spray-on fireproofing was applied on the beams and columns. Pipe insulation observed within the mechanical equipment rooms and above ceilings consisted of fiberglass and asbestos containing air-cell. Note: the asbestos containing pipe insulation is assumed to be enclosed within wet columns throughout the first and second floors. There is brown asbestos containing 9" x 9" vinyl floor tile throughout the first and second floors, the first floor contained a layer of white non-asbestos containing 12" x 12" vinyl floor tile over the said 9" x 9" vinyl floor tiles. These tiles are fastened to the cement slab with asbestos containing (black) mastic.

Ideal Parking Corp. occupies a total of 107,313 square feet of space of the southeast portions of the first and second floors and occupies the entire basement. The decking and floors were exposed and consisted of bare cement with exception to the second floor where a black non-asbestos containing weatherproofing was applied onto the deck and the walls of the first floor. Throughout the basement there is 5,010 linear feet of asbestos containing pipe insulation.

The boiler room, which has a street access on the first floor, consisted of fiberglass insulation on the piping and flues. There are three boilers one boiler is insulated with fiberglass; the other two are insulated with asbestos containing insulation.

5. Recommendations and Asbestos Removal Estimates

As noted, asbestos is present within the floor tile, floor tile mastic, pipe insulation, spray-on fireproofing, roofing materials, duct tar and roof mounted cooling tower Fill and Drift Eliminator. These materials only need to be removed if impacted by a renovation and can be managed in-place with an Operations and Maintenance Program. The cost to remove the identified asbestos containing materials is outlined in the table below.

Non-Union Contractor

4650 Broadway, New York City, NY

• Floor tile with associated mastic - 1st and 2nd floors	88,282 SF	\$2.45 /SF	=	\$216,291.60
• Spray-on Fireproofing - 1st Floor	4,294 SF	\$6.35 /SF	=	\$27,275.60
• Pipe Insulation - 1st and 2nd floors	1,500 LF	\$8.50 /LF	=	\$12,750.00
• Duct/Furnace - 1st Floor	1,266 SF	\$12.00 /SF	=	\$15,192.00
• Pipe Insulation - Basement	5,016 LF	\$11.25 /LF	=	\$56,342.00
• Roof Membrane and Flashing	60,159 SF	\$3.32 /SF	=	\$200,305.16
• Wall and Duct Tar - Roof	1,500 SF	\$6.35 /SF	=	\$9,525.00
• Cooling Tower Fill - Roof	192 SF	\$15.10 /SF	=	\$2,899.20
	Total		=	\$588,183.65

Union Contractor

4650 Broadway, New York City, NY

• Floor tile with associated mastic - 1st and 2nd floors	88,282 SF	\$4.25 /SF	=	\$375,071.00
• Spray-on Fireproofing - 1st Floor	4,294 SF	\$9.35 /SF	=	\$36,104.40
• Pipe Insulation - 1st and 2nd floors	1,500 LF	\$12.75 /LF	=	\$19,125.00
• Duct/Furnace - 1st Floor	1,266 SF	\$14.00 /SF	=	\$17,640.00
• Pipe Insulation - Basement	5,016 LF	\$12.50 /LF	=	\$62,625.00
• Roof Membrane and Flashing	60,159 SF	\$4.75 /SF	=	\$289,847.75
• Wall and Duct Tar - Roof	1,500 SF	\$12.00 /SF	=	\$18,000.00
• Cooling Tower Fill - Roof	192 SF	\$18.30 /SF	=	\$3,513.60
	Total		=	\$841,226.75

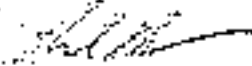

The removal project needs to be completed by a NYSDOL Certified Asbestos Contractor with NYCDEP Certified Supervisors and Handlers. The project will require filing with the NYCDEP utilizing a variance for the floor tile, cooling tower fill and pipe insulation.

1.0 INTRODUCTION

CNS Management Corp. (CNS) was retained by Avonda Realty Trust to conduct a Limited Phase II Subsurface Investigation at 4650 Broadway, in the city of New York, New York; referred to hereafter as the subject site; in compliance with New York State Department of Environmental Conservation (NYSDEC) "Spill Guidance Manual - Site Investigation Procedures" and draft document "DEIR-10 - Technical Guidance for Site Investigation and Remediation (12/07).

Based upon the review of a Phase I Environmental Site Assessment completed by Soil Mechanics Environmental Services and given the potential of soil and/or groundwater contamination at this location, CNS performed the limited subsurface investigation as due diligence, in response to a property acquisition.

The subject site consists of approximately 0.9 acres and is a two story commercial building with a full basement bounded by Residential Apartments/1st Floor Commercial Businesses to the North and East, Sheridan Avenue to the South and Broadway/East Tyron Park to the West. The subject site is currently utilized by the New York City Department of Welfare and the Ideal Parking Corp., a parking garage facility. See Figure 1: Site Plan.

2.0 BACKGROUND

CNS received a Phase I Environmental Site Assessment compiled by Soil Mechanics Environmental Services dated February 2013 for the subject site. Below is a brief summary of the report.

Phase I Environmental Site Assessment compiled by Soil Mechanics Environmental Services

The Phase I Environmental Site Assessment compiled by Soil Mechanics Environmental Services stated that the subject property was developed in 1928 on vacant land. The subject site is currently utilized by the New York City Department of Welfare and a parking garage facility. Previous to the above tenant, an auto sales and service business occupied the subject site until approximately 1950-1960. Soil Mechanics Environmental Services indicated that there is currently one (1) Aboveground Storage Tank (AST) containing #2 fuel oil located in the basement boiler room. In addition to the above listed AST, five (5) Underground Storage Tanks have been removed/abandoned at the subject site. A table of the AST and USTs is presented below.

Type of Tank	Status	Capacity	Material
AST	Active	5,000 gallon	#2 Fuel Oil
UST	Removed (12-1-98)	5,000 gallon	#2 Fuel Oil
UST	Removed (9-1-98)	2,500 gallon	#2 Fuel Oil
UST	Closed in place (1983)	550 gallon	Gasoline
UST	Closed in place (1983)	550 gallon	Gasoline
UST	Closed in place (1983)	550 gallon	Gasoline

Soil Mechanics Environmental Services stated that the affidavit relating to the closed/abandoned Gasoline USTs indicated that the gasoline was removed and the USTs were filled with concrete along with all lines except vents.

Spillage and oil-like staining was observed by Soil Mechanics Environmental Services in the boiler room adjacent to the AST, boilers and floor drains. This boiler room was observed to contain a total of three (3) boiler units, one (1) 5000 Gallon AST, an oil sump pit and pump and numerous containers of waste oil. Furthermore, staining was observed throughout the parking garage area due to general automobile activities.

The subject site was listed in the environmental database report under registered USTs and ASTs. It was indicated in the UST database that two (2) USTs were closed/removed on September 1, 1988 and the AST database listed the current 5000 Gallon oil fuel oil AST, installed on October 1, 1998.

Soil Mechanics Environmental Services concluded that with respect to the historical uses of the subject property and the suspected former USTs, a Phase II Subsurface Investigation is warranted.

CNS noted that the installation date of these gasoline USTs was in 1939 and 1941, indicating that the previous auto sales and service business utilized these USTs for the company's business. After interviewing personnel at the subject site, it is not known whether the current tenants also utilized these former gasoline USTs before they were closed/abandoned.

3.0 GEOLOGY / HYDROGEOLOGY

Based on site observations, the site topography is gently sloping from the West towards the East. The subject site is 100% urban. Groundwater flow is assumed to follow the topography of the subject site towards the East. A large rocky outcrop was observed in Fort Tyron Park located adjacent to the subject site to the West, also supporting regional groundwater flow towards the East.

Based on observations made during the collection of subsurface borings, the soil strata generally consisted of concrete atop of brown fine sand, brown loamy sand and brown sandy loam to burly siltclays. Petroleum stains and odors were noted in soil boring SB-01. Boring cuttings were observed at various depths ranging from 2 to 18 feet below the ground surface (bgs). Saturated soil was encountered in soil borings SB-01 and SB-05 at a depth of 5.5 feet bgs. Groundwater was also encountered in soil borings SB-01 and SB-05 at a depth of 6 feet bgs. See Appendix A for the Soil Boring Logs.

4.0 FIELD ACTIVITIES

On Friday, January 21st and Tuesday, January 25th, 2024, CNS completed a total of five (5) subsurface borings (SB-01 through SB-05) at the subject site in the vicinity of the boiler room which contains active boilers and a 5000 Gallon AST (See Figure 1: Site Map). The drilling was completed by Soil Mechanics Environmental Services utilizing mobile split spoon methods. The ambient temperature was 15°F and the skies were cloudy. A total of five (5) soil samples were obtained from borings SB-01, SB-02, SB-04 and SB-05 at depths ranging from 1 to 15 feet below ground surface. A groundwater sample was only collected in SB-05 by CNS at the subject site due to the lack of groundwater present in SB-01, SB-02 and SB-04. Although groundwater was detected in soil boring SB-01, due to the very slow recharge rate and viscosity of the groundwater, not enough groundwater could be extracted to obtain a sample. See Appendix A for Soil Boring Logs.

All of the collected soil samples were placed in laboratory-supplied glassware, packed in ice-filled coolers accompanied by chain-of-custody documentation and transported to Analytica Corporation located at 8040 Villa Park Drive, Richmond, Virginia.

The collected soil and groundwater samples were analyzed for Volatile Organic Compounds (VOCs) and Semi-Volatile Organic Compounds (SVOCs) in accordance with USEPA Methods 8260 and 8270 respectively. The analytical results were compared to the NYSDEC TAGM #4046 Allowable Soil Concentration and Recommended Soil Cleanup Objectives as outlined in Tables 1 and 2.

5.0 ANALYTICAL RESULTS

Soil Sample Results

Soil samples were collected from borings SB-01, SB-02, SB-04 and SB-05. Analytical results identified VOC contaminants above NYSDEC's TAGM #4046 Allowable Soil Concentration and Recommended Soil Cleanup Objectives. Analytical results did not identify any SVOC contamination at the subject site. A summary of the VOC contaminants above NYSDEC TAGM #4046 Allowable Soil Concentration and Recommended Soil Cleanup Objectives are presented below.

Analysis	Contaminant	SB-01A 4-21 (ppm)	SB-01B 11-10 (ppm)	SB-04A 1-10 (ppm)	SB-01A 4-21 (ppm)	SB-05A 6-10 (ppm)	NYSDEC #4046 Allowable soil Concentration (ppm)	NYSDEC #4046 Rec. Cleanup Objective (ppm)
VOC	1,2,4-Trichlorobenzene	9.05	46.5	ND	ND	ND	6.11	05
	1,3,5-Trichlorobenzene	2.21	13	ND	ND	ND	0.473	1.3
	Benzofuran	3.33	2.41	ND	ND	ND	0.684	3.3
	Benzo(a)pyrene	0.22	1.49	ND	ND	ND	0.025	2.3
	ATP Nylone	4.49	6.93	ND	ND	ND	0.412	1.4
	N-Dodecane	ND	3.59	ND	ND	ND	0.17	10
	N-Dodecylamine	0.66	2.51	ND	ND	ND	0.0517	1.7
	Hexadecane	1	2.08	ND	ND	ND	0.11	13
	Octadecane	1.89	1.4	ND	ND	ND	0.11	10

See Tables 1 and 2 for USEPA 8260 and 8270 analytical results.

Groundwater Sample Results

A groundwater sample was collected only from boring SB-05 due to the lack of groundwater present in borings SB-01 through SB-04. Analytical results identified only Acetone, a common laboratory artifact, above the measured detection limit and below the NYSDEC's Groundwater Standards. A summary of the VOC contaminants above the measured detection limits are presented below.

Analysis	Contaminant	SB-05A (ppm)	NYSDEC #4046 Groundwater Standards (ppm)
VOC	Acetone	0.01	5

See Tables 1 and 2 for USEPA 8260 and 8270 analytical results.

6.0 CONCLUSIONS AND RECOMMENDATIONS

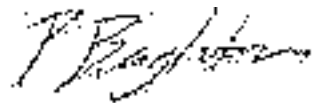

As indicated herein, soil analytical results did not identify any SVOC contamination at the subject site, which is associated with fuel oil; however VOC contamination was detected above the NYSDEC's FACM #4036 Allowable Soil Concentration and Recommended Soil Cleanup Objectives in soil boring SB-01. Therefore it can be concluded that the soil contamination is emanating from a source of gasoline range organics.

As mentioned herein, the Phase I Environmental Site Assessment completed by Soil Mechanics Environmental Services, Inc. (3) 550 Gallon Gasoline UST's were installed in 1939-1941 and closed in place in 1983. Based on the sample results CNS Management Corp. recommends that the closed/abandoned UST's be located with a Ground Penetrating Radar in the vicinity of the boring SB-01 and within the boiler room to determine if these closed/abandoned UST's are presently contributing to the VOC contamination. See drawing number EA2 for an assumed contamination plume.

80. Heptachlorocyclopentadiene	410104	5.0	1,1,1,2,2,2-Hexachloroethane	410104	5.0

1. System Minimum Detection Level (MMDL) for Method 8260 is not applicable.
 2. Concentrations from this report are based on the following: 100% H₂O.
 3. Concentrations exceeding the MMDL are reported as such.
 4. Blank test results are reported as ND.
 5. ND - Not Detected.

NOTE: Extraction Efficiency (EE) values are based on analytical recoveries.
 Concentrations above EEPL are highlighted in dark BLACK.
 Concentrations exceeding the ANYSOC Allowable Sp. Concentration for USEL are highlighted in BLUE.
 EEPL = 1000 ug/kg soil
 ANYSOC = 1000 ug/kg soil

MSDCU
 2. Matrix Spike/Recovery Data (MSR): For Method 8270 analysis and for non-volatile
 concentrations above MRL, the MSR should be less than 100%.
 Concentrations exceeding the MSRL are also indicated by MSR. Concentrations are reported as % of MRL.
 MSR = (Recovery) / (100%)

The following types of samples were submitted for analysis on January 25, 2005

1 - Soil Sample

Attached are the results we obtained on the analysis of your samples. Any chains-of-custody associated with this sample group are enclosed. Also enclosed is a copy of the Sample Container Receipt Form. The Sample Container Receipt Form documents the condition of the sample upon arrival at the laboratory. The last page of this report is identified by the signature of a designated laboratory manager(s). Any reproduction of this report, except in full, is not permitted without written approval of the laboratory manager and the QA manager.

The analyses performed are based on the referenced method. For details on the analytical process refer to the Standard Operating Procedure for the referenced method. The signatures at the end of this report certify that the results are based on the referenced methods and unless otherwise noted meet the requirements of NELAP.

Unless otherwise specified all analyses of solid materials are based on dry weight.

We appreciate your confidence in allowing Analytice to be your testing laboratory. Any questions regarding this report can be addressed by calling our client services department (800-830-9061).

Thank you for your business.

25-092-001 and -002 analyzed by Method 8260 had recoveries for bromofluoromethane below QC limits.

Matrix spike analyzed by Method 8260 had recovery for the following compounds below QC limits: Benzene, Toluene, and Chlorobenzene.

Matrix spike duplicate analyzed by Method 8260 had recovery for toluene and Chlorobenzene below QC limits.

Report limits = PQL = Practical Quantitation Limit; DL = lowest reportable value

Abbreviations: ug/L = micrograms per liter, mg/L = milligrams per liter, ug/g = micrograms per gram, mg/kg = milligrams per kilogram, ug/wp = ug/wipe, ug/ml = micrograms per milliliter, PQL = Practical Quantitation Limit, uS = microsiemens/centimeter at 25 degrees Celsius, ppb = parts per billion.

The following types of samples were submitted for analysis on February 01, 2005.

1 - Soil Sample; 3 - Water

Attached are the results we obtained on the analysis of your samples. Any Chain-of-Custody associated with this sample group are enclosed. Also enclosed is a copy of the Sample Container Receipt Form. The Sample Container Receipt Form documents the condition of the sample upon arrival at the laboratory. The last page of this report is identified by the signature of a designated laboratory manager(s). Any reproduction of this report, except in full, is not permitted without written approval of the laboratory manager and the QA manager.

The analyses performed are based on the referenced method. For details on the analytical process refer to the Standard Operating Procedure for the referenced method. The signatures at the end of this report certify that the results are based on the referenced methods and unless otherwise noted meet the requirements of NELAP.

Unless otherwise specified all analyses of solid materials are based on dry weight.

We appreciate your confidence in allowing Analytics to be your testing laboratory. Any questions regarding this report can be addressed by calling our client services department (800-888-8061).

Thank you for your business.

132-013-002 analyzed by Method 8260 had a pH of 7.89.

10 matrix spike/duplicate samples analyzed by method 8270 recovered below the QC limits for 1,4-Dichlorobenzene and 1,2,4-Trichlorobenzene. The laboratory control sample had recovery of these compounds within QC limits.

10 laboratory control sample analyzed by method 8270 had recovery of 4-Nitrophenol below QC limits.

Report Limit=PQL=Practical Quantitation Limit; DL=lowest reportable value

Abbreviations: ug/L = micrograms per liter, mg/L = milligrams per liter, ug/g = micrograms per gram, mg/kg = milligrams per kilogram, ug/wipe = ug/wipe, ug/ml = micrograms per milliliter. PQL = Practical Quantitation Limit. S = micrometers/centimeter at 25 degrees Celsius, ppb = parts per billion.

Re: Petroleum Bulk Storage (PBS) Registration
Site: 4650 Broadway (Sherman Ave), New York, New York
CNS Job #: E25-463

Dear Mr. Scholem,

On Thursday September 8th, 2005, CNS Management Corp. (CNS) successfully updated the status of the 5,000 gallon Aboveground Storage Tank (AST) at the above subject site to comply with the New York State Department of Environmental Conservation's (NYSDEC) 6 NYCRR Part 612, Registration of Petroleum Storage Facilities.

This update involved the submittal of the Petroleum Bulk Storage Application regarding the change of ownership status at the subject site and the posting of the Petroleum Bulk Storage Certificate at the premises. See Appendix A: NYSDEC Documents.

Additionally the New York City Fire Department (NYCFD) was contacted and on August 17th, 2005, NYCFD Inspector Tulsie John successfully inspected and updated the AST at the subject site to comply with the Rules of the City of New York, Title 3 Section 24-01. However at the time of inspection, Inspector John indicated that there were existing violations to the previous operator, Bernami Operating Corp. for the removal of two (2) previous ASTs and the installation of the current 5,000 gallon AST. Inspector John of the NYCFD issued a Violation Order (#144621). This Violation Order will need to be addressed by providing the NYCFD with a copy of the affidavit regarding the removal of the previous ASTs and a New York City Department of Buildings "Certificate of Approval" for the use and storage of fuel oil. See Appendix B: NYCFD Violation.

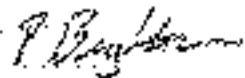

As per the NYSDEC's 6 NYCRR Part 613.6; *Handling and Storage of Petroleum - AST Inspections*, the owner or operator at the subject site must inspect the AST on a monthly basis. Inspecting an AST involves checking the exterior surfaces of the tank, structural supports, piping, leak detection systems and valves for leaks, cracks or any deficiencies. The inspections need to be documented and include the following;

- Facility ID number
- AST number
- Date
- Findings of the inspection and details of the repairs, if any
- A statement that the inspection was conducted in accordance with the requirements in Section 613.6 of the NYSDEC's *Handling and Storage of Petroleum - AST Inspections*
- Address of the inspector
- Signature of Inspector

All inspection documentation must remain on-site for a period of 10 years.

If you have any questions or require any additional information please call me at (516) 932-3228.

Sincerely,

Peter Blighna
Environmental Engineer

*** Aboveground tanks require monthly visual inspections and may need disassembled internal inspections as described in 6 NYCRR Part 613**

An unlicensed representative of the State of New York, utilizing a facility, offering to test a petroleum storage tank, may be liable for the negligent discharge on the part of the test. It is noted that the test of any tank is not a guarantee of its condition. It is the responsibility of the owner of the tank to ensure that the tank is properly inspected and that the test is performed in accordance with the applicable regulations. The test is not a guarantee of the condition of the tank.

- The facility must be registered in the State of New York.
- The facility must be registered within 30 days prior to testing.
- The facility must be registered in accordance with the rules of the State of New York.
- Any other facility in the State of New York must comply with 6 NYCRR 613.

This certificate must be signed and sealed as the president of the firm. The seal must be in the seal of the State of New York, in the main body, where the seal must be in the seal.

FO-4 VIOLATION ORDER SUPPLEMENT

Account # 11339077

Date 8/17/08

VO# 194631

As stated in the violation order you need an affidavit. The *affidavit must* include the following information:

- * Must be on business letterhead and notarized.
- * Must contain the name of the licensee sealing and/or removing the tank(s).
- * The type of license, license number, and the expiration date of such license.
- * The number, location and size of tanks.
- * The type of product removed.
- * State whether the system is a Permanent or Temporary seal.
- * *The affidavit shall specifically state whether the storage system was sealed and/or removed in accordance with the guidelines described in section (c) or (d) of Title 3, RCNY Chapter 21-02.*

§613.1 General

(a) Purpose. The purpose of this Part is to set forth regulations for the handling and storage of petroleum in order to protect the public health, welfare and the lands and waters of the State.

(b) Applicability. This Part applies to all aboveground and underground petroleum storage facilities with a combined storage capacity of over eleven-hundred (1,100) gallons including all facilities registered under Part 612 of this Title. This Part also applies to those facilities licensed under Article 12 of the Navigation Law to the extent provided in Part 610. This Part does not apply to

oil production facilities and facilities regulated under the Federal Natural Gas Act.

(c) Definitions. The definitions found in subdivision 612.1(c) of this Title shall apply to this Part.

(d) Severability. If any provisions of this Part or its application to any person or circumstance is held to be invalid, the remainder of this Part and the application of that provision to other persons or circumstances will not be affected.

(e) Access to records and facilities.

(1) Upon reasonable notice of the commissioner or his designee, the owner or operator must allow any designated officer or employee of the Department at all reasonable times to review and to copy any books, papers, documents and records relating to recordkeeping requirements and compliance with this Part.

(2) Any designated officer or employee of the Department may, at reasonable times and upon reasonable notice, enter and inspect a facility for compliance with this Part, provided that the officer or employee is accompanied by the owner, operator or their designee.

(f) Enforcement. Any person who violates any of the provisions of this Part, or any order issued by the commissioner, shall be liable for the civil, administrative and criminal penalties set forth in Article 71 of the Environmental Conservation Law.

(g) Referenced materials. Citations used in this Part refer to the publications listed below. These publications are available for copying and inspection at the Department of Environmental Conservation, Division of Water, 50 Wolf Road, Albany, New York.

(1) "NFPA No. 30" means National Fire Protection Association, *Flammable and Combustible Liquids Code, No. 30* July 5, 1984, NFPA, Batterymarch Park, Quincy, Massachusetts, 02269. Pages 30-14, 30-15, 30-17, 30-20, 30-21.

(2) "NFPA No. 30A" means National Fire Protection Association, *Automotive and Marine Service Station Code, No. 30A*, July 5, 1984, NFPA, Batterymarch Park, Quincy, Massachusetts, 02269. Pages 30A-7 and 30A-8.

[Back to top of page](#)

§613.2 Bulk storage in flood plains

activity in a flood plain as defined in Part 500 of this Title must be safeguarded against buoyancy and lateral movement by flood walls in accordance with operating standards set forth in NFPA 30, section 2-5.6 (see subdivision 613.1(g)), and in accordance with State and local flood plain regulations. If such safeguards include ballasting of tanks with water during flooding periods, tank valves and other openings must be closed and secured in a locked position in advance of the flood. Ballast water removed from the tank after the flood must not be discharged to the waters of the State if the discharge would contravene the standards of Parts 701, 702 or 703 of this Title.

[Back to top of page](#)

613.3 Overfill prevention and secondary containment systems

(a) Responsibility for transfer. The operator, when on the premises or when in control of a petroleum transfer, shall be responsible for transfer activities. If the operator is not on the premises or not in control of a petroleum transfer, the carrier will be responsible for transfer activities. The operator or carrier will employ practices for preventing transfer spills and accidental discharges. Prior to the transfer, the operator or carrier must determine that the receiving tank has available capacity to receive the volume of petroleum to be transferred. The operator or carrier must monitor every aspect of the delivery and must take immediate action to stop the flow of petroleum when the working capacity of the tank has been reached or should an equipment failure or emergency occur.

(b) Color coding of fill ports.

(1) Beginning five (5) years from the effective date of these regulations, the owner or operator must permanently mark all fill ports to identify the product inside the tank. These markings must be consistent with the color and symbol code of the American Petroleum Institute which follows.

(2) The colors to be used are:

(i)	High gasoline	Red
(ii)	Middle gasoline	Blue
(iii)	Lower gasoline	White
(iv)	High unleaded gasoline	Red w/white cross

i)	Middle unleaded gasoline	Blue w/white cross
ii)	Lower unleaded gasoline	White w/black cross
iii)	Vapor recovery	Orange
iv)	Diesel	Yellow
v)	#1 fuel oil	Purple w/yellow bar
vi)	#2 fuel oil	Green
vii)	Kerosene	Brown

(3) The symbols to be used are:

- (i) a circle for gasoline products and vapor recovery lines;
- (ii) hexagon for other distillates; and
- (iii) a border must be painted around fuel products containing extenders such as alcohol. The border will be black around a white symbol and white around all other colors.

(4) Monitoring wells must be permanently marked and identified as a "monitoring well".

(c) Requirements for valves, gauges and secondary containment systems. Within five (5) years of the effective date of these regulations, the owner must install the following:

(1) Shutoff valves for remote pumping units at motor fuel dispensers. All dispensers of motor fuel under pressure from a remote pumping system must be equipped with a shear valve (impact valve) which is located in the supply line at the inlet of the dispenser. This valve must be designed to close automatically in the event that the dispenser is accidentally dislodged from the inlet pipe. A valve meeting the standards set forth in NFPA No. 30A, section 4-3.6 (see subdivision 613.1(g)) meets the requirements of this subdivision.

(2) Shutoff valves for gravity-fed motor fuel dispensers. All tanks which cause a gravity head on a dispenser of motor fuels must be equipped with a device such as a solenoid valve which is positioned adjacent to and downstream from the operating valve required in paragraph 613.3(e)(5). The valve must be installed and adjusted so that liquid cannot flow by gravity from the tank in case of piping or dispenser hose failure. A valve meeting the standards set forth in NFPA 30A, section 2-1.7 (see subdivision 613.1(g)) meets the requirements of this

subdivision.

(3) Gauges for aboveground storage tanks.

(i) All aboveground petroleum tanks must be equipped with a gauge which accurately shows the level of product in the tank. The gauge must be accessible to the carrier and be installed so it can be conveniently read.

(ii) The design capacity, working capacity and identification number of the tank must be clearly marked on the tank and at the gauge.

(iii) A high level warning alarm, a high level liquid pump cutoff controller or equivalent device may be used in lieu of the gauge required above.

(4) Check valve for pump-filled tanks. All fill pipes leading to a pump-filled petroleum tank must be equipped with a properly functioning check valve or equivalent device which provides automatic protection against backflow. A check valve is required only when the piping arrangement of the fill pipe is such that backflow from the receiving tank is possible.

(5) Operating valves for gravity-drained tank. Each tank's connection through which petroleum can normally flow must be equipped with an operating valve to control the flow. A valve which meets the standards set forth in NFPA No. 30, section 2-2.71.1 (see subdivision 613.1(g)) meets the requirements of this paragraph.

(6) Secondary containment system for aboveground tanks.

(i) A secondary containment system must be installed around any aboveground petroleum storage tank which:

(a) could reasonably be expected to discharge petroleum to the waters of the state, or

(b) which has a capacity of ten thousand (10,000) gallons or more. The secondary containment system must be constructed so that spills of petroleum and chemical components of petroleum will not permeate, drain, infiltrate or otherwise escape to the groundwaters or surface waters before cleanup occurs. The secondary containment system may consist of a combination of dikes, liners, pads, ponds, impoundments, curbs, ditches, sumps, receiving tanks and other equipment capable of containing the

product stored. Construction of diking and the storage capacity of the diked area must be in accordance with NFPA No. 30, section 2-2.3.3 (see subdivision 613.1 (g)).

(ii) If soil is used for the secondary containment system, it must be of such character that any spill onto the soil will be readily recoverable and will result in a minimal amount of soil contamination.

(iii) Storm water which collects within the secondary containment system must be controlled by a manually operated pump or siphon, or a gravity drain pipe which has two manually controlled dike valves, one on each side of the dike. All pumps, siphons and valves must be properly maintained and kept in good condition. If gravity drain pipes are used, all dike valves must be locked in a closed position except when the operator is in the process of draining clean water from the diked area.

(iv) Storm water or any other discharge at a facility must be uncontaminated and free of sheen prior to discharge. Storm water which is contaminated must be treated to reduce petroleum concentration to 15 parts per million or less and to remove any visible sheen prior to discharge. Additional requirements may be imposed under 6 NYCRR Parts 751-758 for protection of the state's waters.

(d) Maintenance of spill prevention equipment. The owner or operator must keep all gauges, valves and other equipment for spill prevention in good working order.

[Back to top of page](#)

§613.4 Inventory monitoring for underground storage facilities

(a) Inventory records

(1) The operator of an underground storage tank must keep daily inventory records for the purpose of detecting leaks. Records must be kept for each tank (or battery of tanks if they are interconnected) and shall include measurements of bottom water levels, sales, use, deliveries, inventory on hand and losses or gains. Reconciliation of records must be kept current, must account for all variables which could affect an apparent loss or gain and must be in accordance with generally accepted practices.

(2) If the tank is unmetered or if the tank contains petroleum for consumptive use on the premises where stored, the operator may detect inventory leakage in an alternative method to paragraph 613.4(a)(1) above. This may include an annual standpipe analysis or other method acceptable to the Department.

(b) Exemptions. No inventory monitoring is required:

- (1) for an underground tank storing No. 5 or No. 6 fuel oil; or
- (2) where the operator can demonstrate to the satisfaction of the Department that it is technically impossible to perform inventory monitoring for the purpose of leak detection.

(c) Maintenance of inventory records

- (1) Inventory monitoring records must be maintained and made available for Department inspection for a period of not less than five (5) years.
- (2) Failure to maintain and reconcile such records constitutes cause for Department-ordered tests and inspections of the facility at operator expense as set forth in section 613.7.

(d) Reporting of inventory losses. If inventory monitoring required in subdivision 613.4(a) shows: an inventory loss; a recurring accumulation of water in the bottom of the tank during any ten-day period; apparent product losses or gains exceed three-quarters (3/4) of one (1) percent of the tank volume; or apparent losses or gains exceed seven and one-half (7.5) gallons per one-thousand (1,000) gallons delivered, the operator must initiate an investigation into the possible causes. If, within forty-eight (48) hours, the causes cannot be explained by inaccurate recordkeeping, temperature variations or other factors not related to leakage, the operator must notify the owner and the nearest regional office of the Department and must take the tank out-of-service in accordance with subdivision 613.9(a) until such cause is determined and necessary repairs or replacements are made.

[Back to top of page](#)

613.5 Underground storage facilities - testing and monitoring

(a) Periodic tightness testing.

(4) Testing schedule

(i) The owner of any underground petroleum storage tank and connecting piping system must have the tank and pipes periodically tested for tightness as shown in Table 1, below.

(ii) Any tank and piping system which is due for an initial test within the first year of the effective date of these regulations or any tank which is of unknown age must be tested within (2) years of the effective date of these regulations.

(iii) If the tank and piping system is due for an initial test but has been tested within a five (5) year period prior to the due date in a manner consistent with criteria set forth in paragraph 613.5(a)(6), the Department may accept this test as the initial test. The test report must be sent to the Department prior to the due date for the initial test.

(iv) Retesting of all tank and piping systems must be completed no later than every five (5) years from the date of the previous test.

(v) If for any reason, testing or inspection is not performed as required in this section, the tank or piping system must be replaced in accordance with sections 614.2 through 614.5 inclusive, 614.7 and 614.14 of this Title or taken out-of-service pursuant to the requirements of section 613.9.

Table 1

Testing Schedule-Underground Tanks

Category A Tank	Unprotected tank	Initial test when the tank is (10) years old. Retested every five (5) years thereafter until permanently closed.
Category B Tank	Corrosion-resistant tank	Initial test when the tank is fifteen (15) years old.

Category C Tank	Corrosion-resistant tank and pipe which have a leak monitoring system or any new tank and pipe installed in conformance with Part 614 of this Title.	Monitoring in accordance with paragraph 613.5(b)(3). No periodic testing is required.
-----------------	--	--

(2) Exemptions. No periodic tightness test is required:

- (i) on a tank and piping system storing No. 5 or No. 6 fuel oil;
- (ii) on a tank and piping system which has a capacity of eleven hundred (1,100) gallons or less unless the Department determines that the tank or piping system could reasonably be expected to leak petroleum to the waters of the State;
- (iii) on tanks and piping systems which are corrosion resistant and have a leak monitoring system;
- (iv) on tanks and piping systems installed in conformance with the standards for new construction set forth in Part 614 of this Title; or
- (v) where the size of the tank exceeds 50,000 gallons or where it is technically impossible to perform a meaningful tightness test. In this case, an alternative test or inspection which is acceptable to the Department must be conducted.

(3) Qualifications of test technicians. All tightness tests must be performed by a technician who has an understanding of variables which affect the test, is trained in the performance of the test and meets the qualifications set forth by the Department.

(4) Test reports (i) A test report must be sent by the owner or technician to the Department no later than thirty (30) days after performance of the test, except any test or inspection which shows the facility is leaking must be reported by any person with knowledge of such leak to the Department within two (2) hours of the discovery of such leak. Notification must be made by calling the telephone hotline (518) 457-7362.

(ii) All test reports must be in a form satisfactory to the Department and must include the following information:

- (a) facility registration number,
- (b) identification number used on the application form required in subdivision 612.2(f) of this Title for tank and piping system tested,
- (c) date of test,
- (d) results of test,
- (e) test method,
- (f) certification by the technician that test complies with criteria for a tightness test in paragraph 613.5(a)(6),
- (g) statement of technician's qualifications,
- (h) address of technician, and
- (i) signature of technician.

(ii) A copy of the test report(s) must be maintained by the owner of the facility for a least five (5) years.

(5) Repair, replacement and closure of leaking systems. Any part of the storage facility which is not tight must be promptly emptied, replaced or repaired in accordance with Part 614 of this Title or taken out-of-service in accordance with section 613.9.

(6) Criteria for tightness test. A tightness test is a test acceptable to the Department which will determine if a tank and piping system is tight or not tight. The test must be capable of detecting a tank or piping leak as small as five-hundredths (0.05) of a gallon in one-hour accounting for variables such as vapor pockets, thermal expansion of product, temperature stratification, groundwater level, evaporation, pressure and end deflection.

(b) Monitoring of corrosion-resistant tanks and pipes.

(1) The owner or operator of any corrosion-resistant underground tank or pipe which is exempt from tightness testing under subparagraph 613.5(a)(2)(iii), must monitor all cathodic protection and leak detection systems.

(2) The adequacy of a cathodic protection system must be monitored at least annually. If at any time the system fails to

provide the necessary electrical current to prevent corrosion, the cathodic protection system must be restored within thirty (30) days. Any tank or pipe with a non-working cathodic protection system will be considered unprotected and must be tested for tightness within one (1) year and retested every five (5) years thereafter until the tank is permanently closed.

(3) The owner or operator must monitor for traces of petroleum at least once per week. All monitoring systems must be inspected monthly. Monitoring systems must be kept in proper working order. If at any time the monitoring system fails to function effectively, it must be repaired within thirty (30) days. Any tank or piping system with a non-working monitoring system must be tested for tightness within one (1) year and retested every five (5) years thereafter until the tank is permanently closed.

(4) Monitoring records for cathodic protection and leak detection systems must be maintained on the premises for a period of at least one (1) year.

[Back to top of page](#)

§613.6 Aboveground storage facilities - inspections

(a) Monthly inspections. The owner or operator of an aboveground storage facility must inspect the facility at least monthly. This must include:

(1) inspecting exterior surfaces of tanks, pipes, valves and other equipment for leaks and maintenance deficiencies;

(2) identifying cracks, areas of wear, corrosion and thinning, poor maintenance and operating practices, excessive settlement of structures, separation or swelling of tank insulation, malfunctioning equipment and structural and foundation weaknesses; and

(3) inspecting and monitoring all leak detection systems, cathodic protection monitoring equipment, or other monitoring or warning systems which may be in place at the facility.

(b) Ten-year inspection

(1) Schedule.

(i) In addition to monthly inspections required above, the

owner or operator must perform a detailed inspection as described in paragraph 613.6(b)(3) below, of any aboveground tank with a capacity of ten thousand (10,000) gallons or more, or any tank with a capacity less than ten thousand (10,000) gallons which could reasonably be expected to discharge petroleum to the waters of the State. The initial inspection must be performed when the tank is ten (10) years old, or within five (5) years of the effective date of these regulations, whichever comes later.

(ii) Any tank which is of an unknown age must be inspected within five (5) years of the effective date of these regulations.

(iii) If a tank is due for an initial inspection but has previously been inspected in a manner consistent with the criteria set forth in paragraph 613.6(b)(3) within a ten (10) year period prior to the due date, the Department may accept this previous inspection.

(iv) Reinspection of all tanks is required no later than ten (10) years from the date of the previous inspection.

(2) Exemptions. Ten-year inspections are not required for:

(i) tanks which are entirely aboveground, such as tanks on racks, cradles or stilts;

(ii) tanks storing No. 5 or No. 6 fuel oil; or

(iii) Tanks installed in conformance with the standards for new construction set forth in sections 614.6 through 614.11 inclusive, of this Title.

(3) Requirements for ten-year inspections. A ten (10) year inspection must consist of a tightness of the tank and connecting underground pipes or an inspection which consists of the following:

(i) cleaning the tank and difficult to reach areas within the tank in accordance with generally accepted practices;

(ii) removal, transportation and disposal of sludge in a manner consistent with all applicable state and federal laws;

(iii) inspecting the tank shell for soundness and testing all welds and seams on the tank bottom for porosity and

tightness. The test must be consistent with generally accepted industry testing and inspection practices. This may include one or a combination of the following: a tightness test, an air pressure, hydrostatic or vacuum test, a penetrant dye test, a non-destructive test to detect thinning of the tank or hammering to detect weak areas;

(iv) visual inspection of the internal surfaces of the tank and difficult to reach areas for corrosion or failure;

(v) inspection of internal coatings for any signs of failure of the coating system such as cracks, bubbles, blisters, peeling, curling or separation; and

(vi) a tightness test of any connecting underground pipes.

(c) Inspection reports.

(1) Reports for each monthly inspection and ten-year inspection must be maintained and made available to the Department upon request for a period of at least ten (10) years.

(2) The reports must include the following information:

(i) facility registration number,

(ii) identification number for tank inspected,

(iii) date of inspection,

(iv) results of inspection including a report on the need for repair,

(v) certification by the inspector that the inspection has been performed in a manner consistent with requirements of section 613.6,

(vi) address of inspector, and

(vii) signature of inspector.

(d) Repair of equipment deficiencies. If any inspection reveals a leak, a tank or equipment deficiency, a deficiency in monitoring equipment, excessive thinning of the tank shell which would indicate structural weakness when the tank is filled with petroleum, or any other deficiency which could result in failure of the facility to function properly or store and contain the product in storage, remedial measures must be promptly taken to eliminate the leak or

deficiency.

(e) Uninspected facilities. If any portion of a facility is not inspected as required, the uninspected portion of the facility must be taken out-of-service pursuant to the requirements of section 613.9.

[Back to top of page](#)

§613.7 Additional testing and inspection requirements

When a leak of petroleum is suspected or appears probable, or where tests or inspections have not been performed, or where accurate inventory records are not kept and reconciled as required in section 613.6, the Department may order the owner or operator to inspect and to test the tanks or equipment for tightness and structural soundness. If the owner or operator fails to conduct such tests and inspections within ten (10) days, the Department may conduct inspections or tests for tightness or structural soundness. The expenses of conducting such tests as ordered by the Department shall be paid by the facility owner.

[Back to top of page](#)

§613.8 Reporting of spills and discharges

Any person with knowledge of a spill, leak and discharge of petroleum must report the incident to the Department within two (2) hours of discovery. The results of any inventory record, test or inspection which shows a facility is leaking must be reported to the Department within two (2) hours of the discovery. Notification must be made by calling the telephone hotline (518) 457-7362.

[Back to top of page](#)

§613.9 Closure of out-of-service tanks

(a) Closure of tanks temporarily out-of-service

(1) Storage tanks or facilities which are temporarily out-of-service for thirty (30) or more days must be closed as follows:

- (i) All products must be removed from the tank and piping system to the lowest draw-off point. Any waste product removed from the tank must be disposed of in accordance

with all applicable state and federal requirements. Tanks must be protected from flotation in accordance with good engineering practices.

(1) All manways must be locked or bolted securely and fill lines, gauge openings or pump lines must be capped or plugged to prevent unauthorized use or tampering.

(2) Storage tanks or facilities which are temporarily out-of-service are subject to all requirements of this Part and Part 612 of this Title including, but not limited to, periodic tightness testing, inspection, registration and reporting requirements.

(b) Closure of tanks permanently out-of-service.

(1) Any tank or facility which is permanently out-of-service must comply with the following:

(i) Liquid and sludge must be removed from the tank and connecting lines. Any waste products removed must be disposed of in accordance with all applicable state and federal requirements.

(ii) The tank must be rendered free of petroleum vapors. Provisions must be made for natural breathing of the tank to ensure that the tank remains vapor free.

(iii) All connecting lines must be disconnected and removed or securely capped or plugged. Manways must be securely fastened in place.

(iv) Aboveground tanks must be stenciled with the date of permanent closure.

(v) Underground tank(s) must either be filled to capacity with a solid inert material (such as sand or concrete slurry) or removed. If an inert material is used, all voids within the tank must be filled.

(vi) Aboveground tanks must be protected from flotation in accordance with good engineering practice.

(2) Storage tanks or facilities which have not been closed pursuant to paragraph 613.9(b)(1) above, are subject to all requirements of this Part and Part 612 of this Title including but not limited to periodic tightness testing, inspection, registration and reporting requirements.

(c) Reporting of out-of-service tanks. The owner of a tank or facility which is to be permanently closed must notify the Department within thirty (30) days prior to permanent closure of the tank or facility pursuant to the requirements of subdivision 612.2(d) of this Title.

(d) Used tanks.

(1) Tanks which are removed and do not meet the standards for new tanks set forth in sections 614.3 or 614.9 cannot be reinstalled for the purpose of petroleum storage.

(2) If a tank meets the standards for new tanks, it may be reinstalled for petroleum storage if after thorough cleaning and inspection, internally and externally, it is found to be structurally sound and free of pin holes, cracks, structural damage or excessive corrosion or wear. Such tanks must be reinstalled and tested in accordance with requirements of this Part and Part 514 of this Title.

(3) If a tank is to be disposed of as junk, it must be retested for petroleum vapors, rendered vapor free if necessary, and punctured with holes to make it unfit for storage of liquids.

(e) Financial assurances. Forms of surety or financial assurances may be required by the Department to ensure proper closure of facilities. The amount of such financial assurances will be set by the Department. Any requirement of financial assurances must be accompanied by a finding by the Department of the public interest and shall set forth the reasons for requiring such financial assurances.

1.0. INTRODUCTION

This Asbestos Operations and Maintenance (O&M) Program provides The Property Program Manager with guidelines for conducting maintenance activities in those building areas where asbestos-containing materials (ACM) are located throughout 4650 Broadway in New York City, New York. This program adopts regulations set forth in the Rules and Regulations of the City of New York Title 15 Chapter 1, the New York State Department of Labor Industrial Code Rule 26 (ICR26), asbestos regulations and guidelines from the United States Environmental Protection Agency (EPA) Manage Asbestos in Place - A Building Owner's Guide to all Operations and Maintenance Practices for Asbestos-Containing Materials, and Occupational Safety and Health Administration (OSHA) Hazardous Communications regulations.

This manual is intended to provide a basis for implementation of the O&M program based on subject site asbestos survey results, location, condition of any ACM found to exist and questionnaire findings regarding the subject site operations. These guidelines mitigate exposure to existing asbestos materials by in-house maintenance staff, outside vendors, subcontractors or tenants who may impact the identified asbestos located within Appendix D.

The primary purpose of the O&M program is the protection of the health and safety of building occupants and staff through monitoring and communication of potential hazards associated with asbestos exposure. The goals of the program include the periodic monitoring of the condition of known ACM over time, the minimization of any release episodes by minimizing disturbance of ACM, and abatement of asbestos in accordance with federal NESHAP regulations and the regulations enforced by the New York City Department of Environmental Protection and the New York State Department of Labor.

1.1. ASBESTOS MANAGEMENT TEAM:

CORPORATE PROGRAM MANAGER (CPM): The CPM (*Joseph Hogan*) is responsible for Operations and Maintenance Program development and implementation.

ACCOUNT EXECUTIVE: The Account Executive is responsible for communications between consultants for CNS MANAGEMENT (database activities and filing projects).

PROPERTY PROGRAM MANAGER (PPM): PPM (*Mr. Robert Schelen*) is responsible for daily program management at the site.

ASBESTOS CONSULTANT: CNS Management Corp. is certified to assist the CPM in the effecution of this O&M Program. CNS Management is available to perform building surveys, assess conditions of ACM, test and monitor airborne fiber concentration levels, coordinate ACM emergency procedures, conduct asbestos awareness training, and in the implementation of the O&M program, and provide asbestos abatement design and management services, as requested. CNS Management can perform training to the Property Program Manager and staff on-site employees of the owner thereby minimizing the risks caused by the presence of ACM at the subject site through proper execution of the O&M program. CNS Management will assist the CPM in establish company asbestos policies, procedures, and guidelines and the implementation and enforcement for this O&M program at the corporate level.

ASBESTOS ABATEMENT CONTRACTORS: Asbestos Abatement Contractors are responsible for all asbestos clean up, repair and abatement in accordance with all federal and New York State & New York City regulations.

Building superintendents will be directed not to engage in any activity, which will disturb ACM. Cleanup and maintenance of ACM will be conducted only by qualified and licensed asbestos abatement contractors.

Building staff will temporarily stop any activity and notify their supervisor when they work will potentially disturb ACM. The supervisor will notify CNS Management to determine the appropriate response actions.

CNS Management will coordinate all emergency response to asbestos fiber release episodes, scheduled asbestos abatement, and/or other O&M activities throughout the property.

1.2. O&M PROGRAM ELEMENTS:

In order to be effective this O&M Program requires the implementation of the following basic elements:

- Conducting surveys for ACM and removing ACM prior to any planned disturbance in accordance with Rules and Regulations of the City of New York Title 25 Chapter 1, the New York State Department of Labor (CRS) and Federal Emission Standards for Hazardous Air Pollutants (NESHAPS), 40 CFR Part 61 Subpart M.
- Conducting surveys for friable ACM in currently occupied properties constructed prior to 1980 that have suspect friable ACM (for example, pipe insulation and spray applied fireproofing). Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, duct and wall tyrod coating tower fill were identified on the roof.
- Confirming the existence of ACM by testing and removing or otherwise abating the existing ACM prior to any planned disturbance (for example, pipe insulation and spray applied fireproofing). Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, duct and wall tyrod coating tower fill were identified on the roof.
- Implementing operational and maintenance ("O&M") programs in accordance with applicable laws, to manage and periodically assess the condition of ACM at the subject site where friable ACM has been identified.
- Minimizing disturbance of ACM through employee awareness training and hazard communication practices.
- Informing and notifying building staff, vendors and sub-contractors of potential hazards associated with their work activities within the subject site in accordance with applicable federal, state, and local laws and regulations. As required by OSHA 29 CFR 1926.1101, all staff persons who work in the subject site shall be trained in awareness of asbestos which includes the location, condition and general health concerns associated with asbestos exposure. In addition, all outside contractors who work in properties that contain friable ACM will be notified, in writing, by the Account Executives of ACM and made aware of their obligations to their employees.
- Superintendents, maintenance and other building staff who perform routine maintenance or custodial activities will be trained in Asbestos Awareness. CNS Management will conduct awareness sessions. They have to expand on relevant information while allowing residents to raise questions.
- Property Program Managers will provide verification to employees, vendors and outside contractors regarding asbestos-related repair or abatement activities occurring within the building as required by applicable laws and regulations.

1.3 EMERGENCY RESPONSE PROCEDURES:

As long as ACM is present in the property, a fiber release episode could occur if the ACM is inadvertently damaged. Building staff will be trained to immediately report to the Program Manager the presence of suspect asbestos-containing debris on the floor, water or physical damage to the ACM, or any other evidence of a fiber release. Upon notice of an ACM release episode, The Property Program Manager will conduct the following procedures:

- Evaluate the extent of ACM damage;
- Contain contaminated areas against entry by unauthorized personnel;
- Coordinate response clean-up by certified asbestos contractor and personnel;
- Isolate the contaminated area by sealing doors and walls with polyethylene sheeting and duct tape and shutting off or modifying air handling systems or any other modification appropriate to restrict access or prevent exposure in other areas of the property;
- Post a warning sign outside the contaminated area; and
- Contact CMS Management.

If significant damage or deterioration of ACM has occurred, consider total removal of the ACM by a pre-approved professional contractor in the affected areas and replacement with a non-asbestos containing material.

1.4 AREAS WITH FRIABLE ACM:

Friable ACM (for example, pipe insulation and spray applied fireproofing). Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, door and wall tile and ceiling tower fill were identified on the roof.

1.5 COMMON MAINTENANCE ACTIVITIES IMPACTING ACM:

Examples of maintenance activities performed in the subject site, which may impact, suspect or confirmed ACM are listed below. Through site-specific training this work must be performed by taking the proper care and precautions, so as to not disturb the ACM.

Examples of Maintenance Activities Which May Potentially Impact ACM (Hence, all precautions must be taken so as not to disturb ACM while conducting these activities.)

- Maintaining Thermal Pipe Joint Systems; Repairing Leaking Fittings
- Removal of Overlay Carpets; Refinishing
- Sanding, or Grinding Floor Tiles
- Duct Riser Repair or Maintenance
- Accessing Columns or Walls; Repairing Light Fixtures
- Access to Above Suspended Ceilings into plenum
- Changing Fluorescent Light Bulbs

1.6 NEW YORK STATE & NEW YORK CITY REGULATORY REQUIREMENTS:

New York City - Title 25 Chapter 1 of the Rules and Regulations of the City of New York.

New York State - New York State Department of Labor, Industrial Code Rule 26.

2.0 ASBESTOS MANAGEMENT TEAM

CORPORATE PROGRAM MANAGER (CPM):

The CPM (*Joseph Higgins*) has overall responsibility for Program development and implementation. Any deviation from this program must be pre-approved by the CPM.

ASBESTOS CONSULTANT:

CNS Management is used as a qualified and experienced asbestos consultant to assist the CPM and other company representatives. CNS Management is available to perform building surveys, assess conditions of ACM, test and monitor airborne fiber concentration levels, coordinate ACM emergency procedures, conduct asbestos awareness training, and in the implementation of the O&M program, and provide asbestos abatement design and measuring services, as required. CNS Management will train the PPM and employees and they will be responsible for minimizing the risks caused by the presence of ACM in applicable properties through proper execution of the O&M program. CNS Management will assist the CPM to establish company asbestos policies, procedures, and guidelines and the implementation and enforcement for this O&M program at the corporate level.

PROPERTY PROGRAM MANAGER (PPM):

The PPM (*Mr. Robert Scholten*) is responsible for daily Program management at the site. The PPM is designated to interface with the asbestos consultant. The PPM has the implementation responsibility for the implementation of the site-specific O&M Program. The PPM must obtain approval from the CPM to make any deviations in this program.

ASBESTOS ABATEMENT CONTRACTORS:

Asbestos Abatement Contractors are responsible for all asbestos clean up, repair and abatement in accordance with all federal, state and local regulations.

3.0 PURPOSE

The primary purpose of the O&M program is the protection of the health and safety of building occupants and maintenance staff, tenants, vendors and sub-contractors. The goals of this program include the training of house staff of the tenants to address exposure, the periodic monitoring of the condition of ACM, the minimization of fiber release episodes by minimizing disturbance of ACM, and abatement of asbestos when considered necessary due to impending impact or condition of ACM. This program addresses those procedures and practices required to safely perform activities, such as:

- Monitoring of the condition of ACM,
- Performing emergency asbestos abatement and
- Overseeing asbestos waste disposal

This program is also designed to:

- Inform management and building staff of the presence of asbestos at the subject site and of precautions to be taken to prevent potential exposures.
- Provide proper training to building staff.
- Provide necessary safety and personal protective equipment to building staff.
- Provide proper notification to outside contractors on the presence and location of identified ACM.
- Establish schedules for periodic surveillance activities.
- Provide guidelines for response to fiber-release episodes, and
- Facilitate the documentation of all these activities in conformance with applicable regulations and guidelines.

4.0 OPERATIONS AND MAINTENANCE PROGRAM

CNS Management will evaluate the subject site for the purpose of developing and implementing a site specific O&M program. The building staff of the subject site will be notified of ACM presence, as required by law; and, if the ACM is not required to be removed, certain employees will be trained in awareness of asbestos hazards and how to detect and report episodic incidents of damaged ACM to allow for the proper abatement and/or safe cleanup of the ACM.

The PPM will direct all building staff not to engage in any activity, which will disturb ACM. Only qualified and licensed asbestos abatement contractors will conduct cleanup and encasement of ACM.

Building staff will temporarily stop any activity and notify their supervisor when their work will potentially disturb ACM. The supervisor will notify CNS Management to determine the appropriate response actions.

CNS Management will coordinate all emergency response to asbestos fiber release episodes, scheduled asbestos abatement, and/or other O&M activities throughout the property.

4.1 Program Requirements

This Program requires:

- Conducting surveys for ACM and removing ACM prior to any planned disturbance in accordance with Rules and Regulations of the City of New York Title 25 Chapter 1, the New York State Department of Labor 6R56 and National Emission Standards for Hazardous Air Pollutants (NESHAPS), 40 CFR Part 61 Subpart M.
- Conducting surveys for friable ACM in currently occupied properties constructed prior to 1980 that have inspect friable ACM (for example, pipe insulation and spray applied fireproofing). Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, duct and walk-in and cooling tower fill were identified on the roof.
- Confirming the existence of ACM by testing and removing or otherwise abating the existing ACM prior to any planned disturbance (for example, pipe insulation and spray applied fireproofing). Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, duct and walk-in and cooling tower fill were identified on the roof.
- Implementing an Operations and Maintenance ("O&M") program in accordance with applicable laws, to minimize hazards and periodically assess the condition of ACM in Property buildings where friable ACM has been identified.
- Minimizing disturbance of ACM through employee awareness training and other management practices.
- Informing building staff, vendors and sub-contractors in accordance with applicable federal, state, and local laws and regulations.

4.2 Planned Asbestos Work in Occupied Areas

The Asbestos Survey will be utilized to assess the condition and potential hazards posed by ACM and to any, wherever be required to determine extent of ACM impact based upon the results of said survey and arising out of and in conjunction with a planned operation ("Planned Actionable"). The PPM will strive to abate any ACM that is damaged, accessible and friable to the extent it poses an immediate health threat ("Short-Term Actionable") in accordance with applicable laws and regulations.

Abatement will be performed by a qualified and licensed contractor pre-qualified by CNS Management, prior to or in conjunction with any emergency, renovation or demolition work, which could disturb ACM.

4.3 Periodic ACM Surveillance/Inspection

Periodic review of the ACM Program is essential to see that the program objectives are being met. A key feature of the entire is reinspection of all ACM in the property. The reinspection combined with ongoing reports of changes in the condition of the ACM will insure that any damage or deterioration of the ACM will be detected and corrective action taken. Reinspection will be conducted, at a minimum, annually, and more frequently where necessary, as determined by the PPM. Flammable and/or disintegrated material, such as sprayed-on ACM and highly accessible ACM, may require inspections every four months to determine any changes in condition.

CNS Management will conduct the reinspections as authorized by the PPM. CNS Management can develop an inspection schedule, which will be followed annually, or until such time as all asbestos materials are removed.

Forms, which can be used to document the reinspection of materials previously determined to contain asbestos, are provided. Completed forms will be retained in the site manual with other periodic surveillance materials.

4.4 Emergency Response Procedures

As long as ACM remains in the property, a fiber release episode could occur if the ACM is inadvertently disturbed. Building staff will immediately report to the PPM the presence of suspect asbestos containing debris on the floor, water or physical damage to the ACM, or any other evidence of a fiber release. The PPM will conduct the following procedure:

- Evaluate the extent of ACM damage;
- Cordon contaminated areas against entry by unauthorized personnel;
- Coordinate response clean-up by certified asbestos contractor and personnel;
- Isolate the contaminated area by sealing doors and vents with polyethylene sheeting and close tape and shutting off or modifying air handling system or any other ventilation appropriate to restrict access or prevent exposure in other areas of the property;
- Post a warning sign towards the contaminated area; and
- Contact CNS Management.

If significant damage or deterioration of ACM has occurred, consider total removal of the ACM by a pre-approved abatement contractor in the affected areas and replacement with a non-asbestos containing material.

4.5 Asbestos Abatement

Abatement and disposal of ACM will be conducted in accordance with Rules and Regulations of the City of New York Title 25 Chapter 1, the New York State Department of Labor Industrial Code Rule 56 (ICR56). A third party consultant will (1) design large abatement projects, (2) observe the work quality of abatement contractors, (3) inspect applicable employers of the guidance of ACM prior to the abatement work being performed, (4) conduct air monitoring before, during, and after abatement projects, as appropriate, and (5) prepare and submit final abatement project reports.

Preparation of a specification or detailed scope of work will be necessary for major asbestos abatement activities. The specification shall be site-specific and detailed for a particular project or operation. Specifications will be required for all major work by abatement contractors, except for routine operations conducted under the guidance of the designated asbestos consultant. The PPM or the Account Executive will only employ qualified and licensed asbestos abatement contractors for abatement projects, independent of the asbestos consultant and the licensed laboratory.

4.6 Training

4.6.1 Training Requirements

Supervisors, maintenance and other building staff who perform routine maintenance or custodial activities that potentially disturb ACM will be trained in Asbestos Awareness. Each such employee will receive 2-hour asbestos awareness training. The training will consist of information regarding:

- Asbestos and its various uses and forms;
- Health effects associated with asbestos exposure;
- Locations of ACM identified within the building;
- Recognition of damage, deterioration, and delamination of ACM;
- The O&M program for that building; and
- Proper response to fiber release episodes.

Custodial activities may be limited to cleaning and simple maintenance tasks where ACM may have the potential to be accidentally disturbed. Generally, custodial employees will not directly contact friable ACM but may be directed to use the proper equipment when performing custodial maintenance (for example, cleaning asbestos-containing floor tile with non-abrasive brushes). They will be aware of all relevant regulations including the local, state and federal of OSHA and USEPA.

When outside contractors are hired for renovation work in the building, they must be notified of the presence of asbestos, but The PPM will also advise the work practices to ensure that the renovation activities do not result in exposures of building occupants or employees.

4.6.2 Asbestos Awareness Training

As required by OSHA, all building staff personnel who work in properties that contain friable ACM will be trained in awareness of asbestos. In addition, all outside contractors who work in properties that contain friable ACM will be notified, in writing, by the Account Executives of ACS and made aware of their hazardous communication obligation to their employees.

Program Managers will provide notification to applicable employees and outside contractors regarding asbestos-related repair or abatement activities occurring within the building, as necessary and as required by applicable laws and regulations.

4.6.3 Documentation of Training

Records or certificates for each employee trained must be kept on file in the site-specific O&M manual. The records will include the names, the date of training, and the content of the training provided. Information regarding dates and type of training per individual will be stored on a database.

4.7 Notification

4.7.1 Regulatory Notifications

The New York City Department of Environmental Protection, the New York State Department of Labor and the EPA Region 2 office must be notified in writing 45 days prior to each scheduled asbestos abatement project and within 24-hours of any emergency asbestos abatement project. The Account Executives will ensure that the contractor designing planned project work accurately notifies the applicable agencies within the required notification period prior to initiation of work. The Account Executive will ensure that CNS Management is copied on all notifications and project documentation.

4.7.2 Employee Notification

Employers must communicate the hazards of asbestos to employees if ACM is present in their properties or if their employees will work in proximity to ACM.

4.7.3 Program for Informing Building Occupants

A notification program will be initiated. The notification program serves two primary purposes: (1) it alerts affected parties to the presence of ACM in the property, and (2) it provides basic information on avoiding the unnecessary disturbance of ACM. This notification program is based on federal EPA and OSHA requirements.

During abatement work, notification to building occupants, as necessary and/or requested, will either affect individuals, including outside contractors, can be accomplished several ways. Two common methods are:

- Distributing notices/letters, or
- Holding awareness or informational seminars.

The distribution of notices is an effective means of alerting employees about the presence of asbestos. Notices or letters can be tailored to specific parties, and verification that notification was received is easily accomplished.

4.7.4 Contractor Notification

The PPM is responsible to ensure that all outside contractors who may work at the subject site are properly informed in writing using the Contractor Notification form (Appendix C) designed by CNS Management. For all emergency project work the superintendent or the Account Executive will notify CNS Management.

4.8 Labeling And Signs

As required by the regulation, The PPM will inform employees about the presence of ACM by distributing written notices, by posting signs or labels in a visible location where staff can see them.

In order to inform Maintenance, Custodial, and other personnel of potential asbestos hazards, asbestos labeling and/or signage may be necessary at the mechanical equipment rooms, HVAC rooms or other areas accessed by the staff. If easily damaged ACM are present in maintenance areas of the Property, labels will be affixed directly to the ACM or warning signs will be posted. Easily damaged ACM include thermal system insulation (TSI) materials, surfacing material, or any other friable materials.

If ACM labeling is conducted, then labels shall be affixed to all friable ACM within each mechanical or other building area that is not accessible to the public, but is accessible to maintenance, custodial, or contracted personnel.

If signage is implemented at the subject site, in addition to or in place of technical labeling, warning signs will be posted at the entrance to mechanical spaces in which employees uninvolved can be expected to enter and which contain thermal system insulation material, surfacing ACM, or other friable ACM(s). This includes each mechanical or other building area that is not accessible to the public, but is accessible to maintenance, custodial, or contracted personnel. The PPM shall post signs that identify the ACM which is/are present, its/their location, and appropriate work practices which, if followed, will ensure that ACM will not be disturbed.

If required by applicable laws or regulations, The PPM will institute a labeling system to identify ACM. These labels will be permanently displayed and remain posted until ACM are removed. This labeling will serve to alert and remind building staff and service contractors of the presence of the ACM and to avoid inadvertently disturbing the ACM.

The warning label must be readily visible, in large letter size, or a bright color. The label will read as follows:

CAUTION
ASBESTOS
CANCER AND LUNG DISEASE HAZARD
DO NOT DISTURB WITHOUT
PROPER TRAINING AND EQUIPMENT

Warning signs will also be posted in areas where the airborne fiber concentration can be reasonably expected to exceed the OSHA PEL of 0.1 fpc. They serve to prevent unprotected individuals from entering those areas. The warning sign will read as follows:

DANGER
ASBESTOS
CANCER AND LUNG DISEASE HAZARD
AUTHORIZED PERSONNEL ONLY
RESPIRATORS AND PROTECTIVE
CLOTHING
ARE REQUIRED IN THIS AREA

During removal and repair operations, warning signs will be affixed to barriers to warn any bystanders of the potential danger in the area. The signs will read as follows:

POTENTIAL ASBESTOS
HAZARD AREA
DO NOT ENTER

During asbestos remediation performed by trained personnel, the contractor shall be responsible for posting signs as required by OSHA regulations. CMS Management will be available to provide contract assistance.

4.3.1. Asbestos Sampling and Analysis

Two types of asbestos measurements are required based on specific conditions as part of the O&M Program:

- Bulk samples, Polarized Light Microscopy (PLM), Method 40 CFR 763, Subpart F, Appendix A and EPA Method 600/4-82-020 to determine if asbestos is present; and transmission electron microscopy ("TEM") analysis following the procedures outlined in EPA Method 600/R-93/116.
- Air monitoring, Phase Contrast Microscopy (PCM), NIOSH Method 7400, to determine airborne fiber and asbestos fiber concentrations.

Bulk Sampling

Assessments may be necessary to clarify, update, or identify ACM in the property.

Before maintenance, renovation, or construction work is performed in any area, a licensed consultant must be notified to determine if ACM are present. Results from the bulk material sampling assessments will be maintained and will be distributed to appropriate physical executives and/or associates, as necessary and in accordance with applicable federal, state, and local regulations.

Clearance Sampling

This sampling is used to determine if an area meets the regulatory criteria for clearance after a response action, restoration, or remediation has been completed.

4.9 Asbestos-Containing Waste Material Storage and Transportation

Asbestos-containing waste materials generated during O&M procedures will be stored and transported as follows:

- In leak-tight containers with the following warning labels:

DANGER

CONTAINS ASBESTOS FIBERS AVOID CREATING DUST CANCER AND LUNG DISEASE HAZARD

- Waste will be labeled with the name and location of the property where the waste was generated, and the initial accumulation date.
- Waste will not be stored in the properties longer than 7 days from initial accumulation. These containers will be temporarily stored in the premises in a secured container or storage area, for example, a trash can with a locking top or lined a socked cage or cistern.
- All waste must be stored wet.
- A licensed asbestos waste hauler shall transport all waste. A copy of this license issued by the state agency will be retained in the permanent files.
- The waste hauling vehicle will be enclosed.
- An ACM waste shipment record must accompany all waste materials transported to the USEPA-approved landfill.
- The completed waste shipment record must be received from the disposal site within 35 days of the date the waste was accepted by the initial waste hauler. If it is not received within this timeframe, the PPM must contact the hauler and/or the operator of the landfill to determine the status of the waste shipment record.
- If the completed waste shipment record is not received within 45 days, a report must be submitted to the local USEPA Regional Office responsible for administering NESHAP's regulations.

4.10 Record Keeping

The PPMs will maintain all records associated with a fiber release episode, including asbestos abatement contracts, substantial medical information, waste shipment records, etc., Independent Asbestos Consultant's reports (air sampling data), and a fiber release episode report. The PPM will retain all records related to the O&M Program, such as:

- The written O&M Program plan, including work practices.
- Plans and drawings.
- Assessment data (location of ACM).
- Copies of notification and warning programs.
- Description of fiber data, status of ongoing programs, and all analyses and testing methods disseminated.
- Copies of all permits and documentation of maintenance, restoration, and emergency response actions performed.

- Periodic ACM surveillance records, including all air sampling data and photographs;
- Bulk and air sampling reports;
- Chain of custody for laboratory samples;
- Contractor Inmate forms; and
- Waste disposal permits and waste shipment records.

The Account Executive or PPM shall maintain all records associated with asbestos-related activities (for example, testing and medical records) for a period of at least 30 years.

5.1 WORK PRACTICES

5.1 Areas with Friable ACM

Friable ACM has been identified within the Subject site. Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor.

5.2 Areas with Non-Friable ACM

Non-friable PACM (for example, roofing, air and cooling tower fill) typically release fibers only when severely damaged or disturbed. Fiber releases can occur when workers drill, cut, abrade, break, or saw vinyl asbestos floor tile or any other non-friable material. General cleaning and maintenance, however, will not damage the material. USEPA has instituted recommended guidelines when stripping wax or finish coat from asbestos-containing flooring, which must be followed by the building staff. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, duct and wall air and cooling tower fill were identified on the roof.

5.3 Common Maintenance Activities Impacting ACM

Maintenance activities performed at the subject site, which may impact, suspect or confirmed ACM are listed below. This work must be performed by taking the proper care and precautions, so as to not disturb the ACM.

Examples of Maintenance Activities Which May Potentially Impact ACM (Hence, all precautions must be taken so as not to disturb ACM while performing these activities.)

- ✱ Maintaining Heating, Plumber Systems; Requiring Leaking Fixings
- ✱ Removal of Overlay Carpeting, Buffing
- ✱ Sanding or Grinding Floor Tiles
- ✱ Duct Work Repair or Maintenance
- ✱ Accessing Columns or Walls, Repairing High Potentials
- ✱ Access to Above Suspended Ceilings
- ✱ Changing Fluorescent Light Balls

Type of Material Being Potentially Impacted (Disturbance of these materials will be avoided while conducting work.)

- ✱ Pipe Fitting Insulation
- ✱ Floor Tile and Mastic

As required by applicable Federal, State and/or local laws and regulations, The PPMT will inform employees about the location and physical condition of ACM that may be disturbed.

5.4 Recommended Guidelines for Stripping Wax or Finish from Asbestos Containing Flooring

1. AVOID STRIPPING FLOORS. Stripping of floors will be done as infrequently as possible, perhaps once or twice a year or less, depending on circumstances. The frequency will be carefully considered when floor maintenance schedules or contracts are written or renewed.
2. PROPERLY TRAIN STAFF. Operators of building staff that strip floors will be trained in operate the machines and jobs and use floor care chemicals properly and safely.

3. FOLLOW APPROPRIATE WORK PRACTICES. Contracted building staff that strips floors will follow appropriate work practices, such as those recommended here, under informed supervision. Directions from floor tile and floor wax product manufacturers on proper maintenance procedures will be consulted.
4. STRIP FLOORS WHILE WET. The floor will be kept adequately wet during the stripping operations. DO NOT perform dry stripping. Prior to machine operation, an emulsion of chemical stripper in water is commonly applied to the floor with a mop to reduce the wax or finish coat. After stripping and before application of the new wax, the floor will be thoroughly cleaned with water.
5. RUN MACHINE AT SLOW SPEED. If the machine used to remove the wax or finish coat has variable speeds, it will be run at slow speed (about 175-190 rpm) during the stripping operations.
6. SELECT THE LEAST ABRASIVE PAD POSSIBLE. USEPA recommends that the machine be equipped with the least abrasive pad possible to strip wax or finish coat from asbestos-containing floors.

DO NOT STRIP FLOORS. Stop stripping when the old surface coat is removed. Over-stripping can damage the floor and may cause the release of asbestos fibers. DO NOT operate a floor machine with an abrasive pad on un waxed or unfinished floors.

REMEMBER: Improperly removing asbestos-containing floor coverings could result in the release of asbestos fibers. USEPA recommends that you leave asbestos-containing floor covering in place, provided the material is in good condition. However, proper maintenance procedures, such as those previously outlined, will always be followed.

5.5 Cleaning

Cleaning up within specific areas of the property is one of the primary objectives of the O&M Program. The PPM will retain a licensed asbestos abatement contractor (i.e., pre-qualified, approved by CNS Management) to conduct initial cleaning in areas of the property where damaged friable ACM are present as soon as the O&M Program is in place and before the initiation of any response action.

In areas of the property where damaged asbestos-containing thermal system insulation or surfacing material is present, i.e., an episodic event, The PPM will retain a pre-qualified licensed asbestos abatement contractor, approved by the CNS Management, to clean all areas in the immediate vicinity. All cleaning activities are to be recorded and included in the O&M manual.

Subsequent minor repair and routine maintenance will also be conducted by a pre-qualified and licensed asbestos abatement contractor.

INITIAL CLEANING

When damaged friable ACM is present the asbestos abatement contractor must HEPA vacuum and, if possible, wet clean all areas in the immediate vicinity. This includes cleaning all surfaces, such as shelves, walls, light fixtures, equipment housing, and exterior of doors, with damp cloths or a HEPA vacuum.

All mop heads, damp cloths, liquid wastes, debris, filters, or vacuum bags must be disposed in asbestos-contaminated waste.

PERIODIC CLEANING

The determination of where/when periodic cleaning is needed is based on the size of dust burden. The determination will be made as part of the periodic inspection. If cleaning is necessary, a pre-qualified licensed asbestos abatement contractor will clean the area.

The renovation contractor shall remove any debris found near friable damaged ACM using HEPA vacuum or wet methods. The contractor shall HEPA vacuum or steam clean all carpets in rooms with damaged ACM and wet wipe all surfaces in the area. If steam cleaning is used, the liquid waste generated during the process must be disposed as asbestos-contaminated waste. The contractor must dispose of debris, fibers, and/or vacuum bags as asbestos-contaminated waste.

5.6 Work Practices for Maintenance Activities

Before conducting any maintenance or repair work that will potentially damage or disturb ACM, the PEAI shall inspect the area to determine appropriate activities. Whenever the potential for release of asbestos fibers from ACM exists (for example, sanding floor tile, repairing a pipe leak, or working above a suspended ceiling), a certified asbestos abatement contractor as a minimum, will perform all appropriate tasks to mitigate the potential for fiber releases associated with a maintenance activity or will directly perform the work procedures.

Basic O&M procedures to maintain and/or contain asbestos fibers may include wet methods, use of non-enclosures, use of portable power tools equipped with special local ventilation attachments, and avoidance of certain activities, such as sawing, sanding, and drilling ACM.

NOTE: During O&M procedures, the Contractor must perform personal air monitoring. All asbestos waste (generated during these activities) must be handled in accordance with all local, state, and federal requirements and Section 4B herein.

Maintenance activities can be divided into three categories with regard to their potential for disturbing ACM:

CONTACT WITH ACM UNLIKELY - BY HOUSE SUPERINTENDENTS

Maintenance activities or repairs which can be performed without contacting or disturbing the ACM, require a little more than normal care and good workmanship and can be performed by in-house personnel. These include, but are not limited to:

- Repairing non-ACM insulated pipes or valves without disturbing other ACM.
- Routine cleaning activities.

All surfaces will be wetted to remove any settled fibers in the areas that ACM are disturbed. An asbestos abatement contractor will respond to the asbestos fiber release episode.

CONTACT WITH ACM NOT LIKELY BUT POSSIBLE

Maintenance activities or repairs that may have the potential to cause accidental disturbance of ACM require more precautions. This work may be performed by superintendents only if the proper precautions are instituted to minimize the potential ACM disturbance. For example, local isolation may be needed if the chance of disturbance is likely. Activities that fall into this category include, but are not limited to:

- Working on a fixture near thermal system ACM;
- Working on a fixture above suspended ceilings where asbestos-containing sprayed-on fireproofing or masonry or acoustic material is present;
- Installation of telecommunication or electrical conduits above suspended ceilings; and
- Repairing of a pipe that is not insulated with ACM but will disturb ACM on nearby pipes.

PLEASE NOTE: Any pre-cleaning or isolation work required to mitigate the potential of ACM disturbance that **WILL IMPACT ASBESTOS** shall be performed by a certified abatement contractor (i.e. cleaning contaminated ceiling tile or a major repair of thermal insulating ACM).

CONTACT WITH ACM LIKELY OR INTENDED - ONLY BY OUTSIDE ASBESTOS CONTRACTOR

Maintenance activities or repairs that involve intentional small-scale manipulation or disturbance of ACM require special work practices, as outlined in this OSM manual. ACM must be removed by a pre-qualified outside abatement contractor before in-house personnel perform their duties. Personal protective equipment, including respirators and Tyvek suits, and personal air monitoring are required when ACM will be disturbed.

Typical activities include but are not limited to:

- Removing a small segment of thermal system insulation to repair a pipe leak or replace a valve; and
- Removing a small amount of surfacing ACM to install new conduits or pipe braces.

Prior to performing any maintenance activities that will disturb ACM, the PPM staff contact an Independent Asbestos Consultant to provide area air monitoring before, during, and after the ACM disturbance, if necessary.

(NOTE: Under no circumstances will any in-house employee perform this type of small-scale work or any other abatement work. Failure to adhere to this policy will be subject to disciplinary actions.

5.7 Special Work Practices for Planned Renovation Work

Future renovations may involve disturbing ACM or PACM and may also involve building materials previously tested that may contain asbestos. Work, such as moving walls, adding wings, and replacing heating or air conditioning systems may involve breaking, cutting, or otherwise disturbing ACM.

All parties must be aware of potential ACM disturbance early in the project planning stage to determine appropriate actions. Partial or full removal may be necessary before renovation.

CNS Management shall develop guideline specifications or work plans in accordance with LSH/PA, OSHA, HHS, and local regulations, if necessary, for use by the asbestos abatement contractor.

CNS Management shall ensure that the asbestos abatement contractor performs all work in compliance with applicable federal, state, and local laws and regulations. CNS Management will assist in maintaining records of work, including copies of job specifications and electrical documentation provided by the Independent Consultant.

6.0 ASBESTOS REGULATIONS

To date, two federal agencies have been principally responsible for generalizing asbestos control regulations. These two agencies are the U.S. Environmental Protection Agency (EPA) and the Occupational Safety and Health Administration (OSHA). In general, OSHA extends to all private sector employees and employees under federal jurisdiction. USEPA extends to all public and private work settings under federal jurisdiction. In addition, individual states and local municipalities have promulgated their own regulations. The following sections highlight some of these federal and state requirements.

The Construction Industry Standard covers employees engaged in demolition and construction and the following related activities likely to involve asbestos: exposure, removal, encapsulation, alteration, repair, maintenance, insulation, spill/emergency cleanup, transportation, disposal, and storage of ACM. The General Industry Standard covers all other operations where exposure to asbestos is possible, including asbestos exposure to asbestos from buildings that contain ACM. In general, ACM asbestos-related work are covered by the Construction Standard.

OSHA published its final rule on asbestos in the Federal Register on August 10, 1993. The new regulations amend the general industry (1910) and construction (1926) standards issued in 1956 and add a shipyard employment standard (1915). Highlights of the general industry and construction standards follow.

To enforce its standards, OSHA is authorized to conduct workplace inspections. In addition, employees have the right to file an OSHA complaint without fear of punishment from the employer. In turn, employees have the responsibility to follow all safety and health rules. OSHA may not conduct a warrantless inspection without the employer's consent.

OSHA will issue a citation during an inspection if the compliance officer finds a standard is violated. The citation informs the employer and employees of the regulations or standards alleged to have been violated and of the proposed length of time for correction. Monetary penalties may also be imposed.

The permissible exposure limit (PEL) for airborne asbestos fiber concentrations has been lowered to 0.1 fiber per cubic centimeter (f/cc) as an 8-hour time-weighted average (TWA) for all asbestos work in all industries, effective October 11, 1994. There is no action level. The exposure limit remains at 1.0 f/cc, averaged over a 30-minute sampling period.

The general industry standard regulates all activities related to asbestos, except agricultural, that are not covered by the construction and shipyard employment standards. Under this standard, employers must provide ownership training to employees who perform housekeeping activities in areas where ACM or PACM are located. They must also institute a training program for all employees who are exposed to airborne asbestos at or above the PEL, and/or excursion limit and ensure that they participate in the program. The program will be presented before the initial assignment and at least annually thereafter.

OSHA has eliminated the terms "small-scale show damage projects" in the construction standards. Instead OSHA classifies construction activity according to descending degree of risk. Class I work presents the greatest risk potential and Class IV, the lowest.

- Class I work involves the removal of thermal system insulation and patching ACM or PACM.
- Class II work involves removal of any other ACM which is not thermal system insulation or surfacing ACM.
- Class III work is defined as repair and maintenance activities where employees are likely to disturb ACM.
- Class IV is defined as maintenance and custodial activities during which employees disturb ACM and PACM and activities to clean up waste and debris containing ACM and PACM.

Under the construction standard, employers must designate a "competent person" (for example, the Asbestos Consultant) who has the qualifications and authority for ensuring worker health and safety. This person must be capable of identifying existing asbestos hazards in the workplace and selecting the appropriate control strategy to reduce asbestos exposure and have the authority to take prompt corrective action. For Class I and II work, the competent person must be trained in accordance with EPA's Model Accreditation Plan (40 CFR 763) for project designer or supervisor, or its equivalent and, for Class III and IV work, must have completed training equivalent to the 16-hour O&M course developed by EPA for maintenance and custodial workers who conduct activities that will result in the disturbance of ACM. If duties are limited to activities such as cleaning of gutters, a course of lesser duration may be sufficient. An annual refresher course of four hours is also required.

The competent person must be present on all construction activities to supervise all asbestos work performed in regulated areas (an area where Class I, II, or III asbestos work is conducted, an adjoining area where debris and waste from the project may accumulate, and an area where airborne asbestos fiber concentrations exceed or have the potential to exceed the PEL), conduct frequent and regular inspections of the job sites, materials, and equipment as part of required safety and health program.

Employers must institute a training program for all workers who install asbestos-containing products and all workers who perform Class I, II, III, and IV work. Medical surveillance is required for all asbestos workers (for example, outside contractors) who engage in Class I, II, or III work for a combined total of 30 days or more a year or who are exposed above the PEL in the duration limit of 140 fcc.

Employers must communicate the hazards of asbestos to employees if ACM or PACM is present in their properties or if their employees will work with ACM.

Regulations relate to worker/supervisor training, laboratory accreditation, sampling practices (inspection, removal, designs, and air samples), training procedures, and allied matters. Part 73 of the OSHA regulation also deals with training of O&M personnel and other building staff.

Clearance sampling is done using NIOSH 7400 Method (PCM) using 0.01 filter per cubic centimeter or pre-established background filter level as clearance level. Transmission Electron Microscopy (TEM) is optional.

The New York City Department of Environmental Protection and the New York State Department of Labor require 10 days pre-project notification for all projects of regulated areas.

All records associated with asbestos work shall be maintained for 30 years.

(6) National Emission Standards for Hazardous Air Pollutants (NESHAP)

The USEPA National Emission Standards for Hazardous Air Pollutants (NESHAP, 40 CFR Part 61, Subpart M, as amended November 20, 1990) will be considered during any maintenance, renovation, or demolition activities that might disturb ACM. NESHAP's rules apply to the application, removal, and disposal of ACM. Also included in NESHAP are rules concerning manufacturing, spraying, and fabricating ACM. Some highlights of the NESHAP requirements follow.

NESHAP ACM CATEGORIES

NESHAP, as amended November 20, 1990 divides types of ACM into three categories: regulated ACM (RACM), Category I non-friable ACM, and Category II non-friable ACM.

Regulated Asbestos-Containing Materials (RACM)

RACM are friable ACM that contain more than 1 percent asbestos that, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure.

Category I Non-Friable ACM

Category I non-friable ACM include asbestos gaskets, resilient floor coverings, and asphalt roofing products containing more than 1 percent asbestos that cannot be crumbled, pulverized, or reduced to powder by hand pressure.

Category I non-friable ACM that have been made friable or subjected to sanding, grinding, cutting, or abrading are considered to be RACM.

Category II Non-Friable ACM

Category II non-friable ACM include all other forms of non-friable ACM, containing more than 1 percent asbestos that are not included in Category I. Examples include Transite board such as asbestos cement siding.

Category II non-friable ACM that will be or have a high probability of becoming crumbled, pulverized, or reduced to powder are also considered to be RACM.

INSPECTIONS

Inspection is required to identify all forms of asbestos present in a property prior to renovation or demolition activities. These include RACM and Category I and II non-friable ACM.

NESHAP defines demolition as the removal of a total supporting structural member of a property or intentional burning.

NOTIFICATIONS

Notification must be given to the regional EPA Region 2 coordinator and the New York City Department of Environmental Protection and New York State Department of Labor 10 working days prior to demolition of a building regardless of the quantity of RACM present.

Notification must also be provided 10 working days prior to demolition for any property that does contain asbestos.

RENOVATION PROJECTS

NESHAP defines renovation as altering a property or replacement in any way, including removal of ACM.

Notification must be given 10 working days prior to renovation if quantities greater than 100 square feet or 200 linear feet of RACM are removed.

Notification must be provided at least 10 working days before the end of the preceding calendar year if the combined aggregate amount of friable RACM to be removed or stripped during planned renovations in the next calendar year is greater than 200 linear feet or 100 square feet.

REMOVAL REQUIREMENTS

Removal prior to renovation/demolition is required of any RACM that will be affected by such renovation or demolition. Prior to renovation, if the activities would "break up or disturb" RACM, removal may be the only practical alternative.

Friable RACM must be removed using wet removal techniques.

With special approval from USEPA, dry removal is allowed under certain circumstances.

No visible emissions to the outside air are permitted during removal or renovation.

DISPOSAL REQUIREMENTS

No visible emissions to the outside air are allowed during collecting, packaging, transporting, or depositing ACM waste.

Wet ACM may be stored in leak-tight containers.

Containers must be labeled with OSHA labels and provide for generator's identification and property location. A generator's number for hazardous waste is not required.

6.2 Other Federal Agencies

Other federal agencies promulgating asbestos regulations include the Department of Transportation (DOT) on the transport of asbestos and the National Bureau of Standards on standards and protocols for laboratory accreditation.

6.3 State And Local Agencies

The state and local agencies may have additional requirements to those of federal agencies. Therefore, state and local regulations where the property is located must be reviewed and complied. Some of the state and local agencies include the New York City Department of Environmental Protection and the New York State Department of Labor.

6.4 New York City & New York State Regulatory Requirements.

New York City - Title 25 Chapter 4 of the Rules and Regulations of the City of New York.

New York State - New York State Department of Labor Industrial Code Rule 56.

7.0 HISTORY

Asbestos has been determined to be a naturally occurring carcinogen once used in a wide variety of building products. Asbestos-containing materials ("ACM") remain in buildings and exist in certain properties managed by The PPM. The presence of ACM within a building does not, in and of itself, pose a hazard to human health. This program is designed to control the possible health risks, which could be created if excessive asbestos fibers are released.

A naturally occurring mineral, asbestos is a fibrous hydrated silicate which possesses the unique characteristics of high tensile strength, flexibility, and chemical, electrical, and thermal resistance, and yet is relatively inexpensive. As a consequence of these properties, the commercial use of asbestos has been exceedingly widespread and is found in products ranging from cosmetics to insulation.

The earliest recorded use of asbestos was about 2500 B.C. in Finland where the mineral was used to strengthen clay pots. More recently though, modern industrial exploitation of this silicate dates from the 1880's when it was mined in Canada and the U.S.S.R. The use of asbestos rapidly increased in England and France, where the fibers were incorporated into cotton fabrics, thereby producing incombustible fabrics. However, the real growth, especially in the West, has been in the past 30 years, since the Second World War. Asbestos is still used in many products today.

There are six asbestos minerals which are used in over 1,000 commercial applications. The six asbestos minerals are as follows:

Serpentines- These asbestos minerals have a sheet or layered crystalline structure.

- **Chrysotile**, the only mineral in the serpentine group, is the most commonly used type of asbestos and accounts for approximately 95% of the asbestos found in buildings in the United States. Chrysotile is commonly known as "white asbestos", so named for its natural color.

Amphiboles- These asbestos minerals have a chain-like crystalline structure.

- **Amosite**, the second most likely type of asbestos mineral to be found in buildings, is often referred to as "brown asbestos", also due to its natural color.
- **Crocidolite**, "blue asbestos", was utilized in high temperature industrial applications.
-

Anthophyllite, tremolite, and Actinolite, are extremely rare and of little commercial value. Occasionally, they are found as contaminants in ACMs.

8.0 POTENTIAL HEALTH CONCERNS

8.1 Exposure Potential

Construction materials containing friable asbestos have been used extensively in commercial buildings, especially those built prior to 1975, although it has been found in buildings constructed in the early 1980's. Some non-friable materials (for example, floor tile, mastic, and joint compound) have been known to be contained in buildings constructed after 1980. The concern about exposure to asbestos in these buildings is based on evidence linking various respiratory diseases with intensive occupational exposure to asbestos, primarily in the shipbuilding, mining, milling, and fabricating industries.

After performing numerous assessments of asbestos fiber levels in air, the USEPA found that average asbestos levels inside buildings are essentially the same as levels outside buildings. USEPA determined that intact, undisturbed asbestos materials do not pose a health risk and that the mere presence of asbestos in a building does not mean that the health of the building occupants is endangered.

The presence of asbestos in a building does not mean that the occupants are at risk. If ACM remain in good condition and are unlikely to be disturbed, exposure will be negligible. However, when ACM are damaged or disturbed (for example, by maintenance, repairs, or renovations conducted without proper controls) asbestos fibers can be released.

Friable ACM (such as which can be crumbled, pulverized, or reduced to powder by hand pressure) present a potential source of exposure and must be carefully protected from damage or disturbance. In materials where asbestos fibers are firmly encased in a solid matrix, such as certain asbestos pipe or vinyl asbestos floor tile, there is a reduced possibility of airborne asbestos fiber exposures, except during cutting, demolition, drilling, grinding, and sanding.

Risks associated with low level, non-occupational exposure have not been well defined. As a result, USEPA has instituted measures for schools to control or eliminate exposures (AHERA regulations).

The AHERA regulation is considered "state-of-the-art" for asbestos control and is often used as a guideline by private industry. This O&M Program generally follows the guidelines issued by the AHERA regulation since they are important in limiting employee risk of asbestos exposure.

8.2 Potential Health Effects

The potential adverse health concerns associated with asbestos exposure have been extensively studied for many years. Results of these studies and epidemiological investigations have demonstrated that extensive and intensive inhalation of asbestos fibers may lead to the highest risk of developing one or more diseases.

It is important to recognize that most people who have developed a disease as a result of asbestos exposure were asbestos workers (for example, miners, factory workers, and ship builders). These workers were frequently exposed to very high concentrations of asbestos fibers each working day with little or no protection.

Ambient levels in buildings today are typically one of thousands times lower than those measured in the past during mining, milling, and ship building activities (USEPA, 1980). Additionally, today's workers follow specific work practices and wear appropriate personal protection, including respirators, to minimize the risk of exposure.

THE RESPIRATORY SYSTEM

The primary health concerns of asbestos are due to excessive inhalation of high concentrations of asbestos fibers. As air is breathed in, it passes through the nostrils and into the windpipe or trachea. The trachea splits into two smaller airways called the bronchi. Each bronchus divides into smaller and smaller tubes which lead into air sacs. These air sacs are called alveoli. In these air sacs (alveoli), oxygen passes through the alveoli membrane and is absorbed into small blood vessels. Carbon dioxide and other waste gases pass out of the blood back into the alveoli where they are exhaled.

The lung is comprised of two lobes and sits in the pleural cavity. The lining of the cavity and the membranes around the lung are in contact with each other and are very moist. Like two pieces of glass with a drop of water between them, these membranes slide easily across each other, but are very difficult to pull apart. Thus, as the chest cavity expands, the lungs do too, and air rushes in. If these lining- (mesothelium) become damaged, one would not be able to inhale properly.

The body has several mechanisms by which it "filters" the air breathed. First, very large particles are removed in the nose and mouth. Smaller particles are caught on the mucous-coated walls of the airways. These airways have a hair-like lining (ciliated cells) which constantly beats upward. The ciliated cells sweep the particles up the airway and into the mouth where particles are either swallowed or expelled. Particles caught in the mucous are swept into the back of the mouth.

Cigarette smoking temporarily paralyzes these ciliated cells, inhibiting one of the body's natural defenses against inhaled dust. As the smoker sleeps, the hairlike cells start working again and carry large amounts of mucus into the back of the mouth. This causes the so-called "smoker's hack" in the morning. After the first cigarette or two, the cleansing mechanism is paralyzed again and the coughing stops, allowing more particles to enter into the deeper airways and cause potential damage. For this reason, smokers who are exposed to asbestos appear to be at greater risk than non-smokers.

Even with these natural defenses of the body, some dust particles inevitably reach the tiny air sacs. When this occurs, large cells (called macrophages) attempt to engulf the particle and "digest" it. In this regard, they are sometimes called the "lungs" garbage collector. However, because asbestos is a mineral fiber, the macrophages are sometimes unsuccessful. In a secondary defense mechanism, these macrophages deposit a coating on the fibers when they are unsuccessful in digesting them. This reaction causes a series of chain reactions that ultimately result in the development of scar tissue in the lung. Where the presence of scar tissue disrupts normal respiratory function, asbestosis may develop.

ASBESTOSIS

Asbestosis is a disease characterized by fibrotic scarring of the lung. It is a restrictive disease that reduces the capacity of the lung and hampers its ability to exchange gases. The earliest symptom is coughing. Asbestosis is prevalent among workers who have been exposed to large doses of asbestos fibers over a long period of time. There is a clear dose-response relationship between asbestos exposure and development of the disease. This means that the greater the asbestos exposure, the more likely asbestosis will develop.

Asbestosis is irreversible and can progress even after exposure has ceased. As the disease progresses, shortness of breath is commonly observed along with changes in lung function, a crackling sound in the lower half of the lung, and clubbed fingers.

Although most people believe a threshold exposure level exists below which the disease does not occur, this threshold level has not yet been determined. All forms of asbestos have demonstrated the ability to cause asbestosis. Like all diseases associated with asbestos exposure, it may take many years for the disease to develop. The typical time of symptoms of diseases to appear from the time of the exposure latency period for asbestosis is 15 to 30 years.

LUNG CANCER

There are many causes of lung cancer, of which asbestos is only one. While employees exposed to industrial concentrations of asbestos in years past have an increased risk of getting lung cancer five times the normal population, their risk is not as great as the cigarette smoker whose risk is ten times the normal. A cigarette smoker who also works with asbestos is 50 times more likely to contract lung cancer than the normal non-smoking population. The cigarette smoking and asbestos exposure multiply the effects of each other. This is known as a synergistic effect. (Seltzer Studies, 1979).

Like asbestosis, there exists a long lag time between initial exposure and the occurrence of lung cancer which is typically 20 to 30 years. There appears to be a dose-response relationship between asbestos exposure and lung cancer although no "safe" lower exposure level has yet been determined. Again, these figures relate to past industrial situations where workers wore little or no personal protective equipment.

MESOTHELIOMA

The asbestos-associated disease of greatest concern in asbestos work is probably mesothelioma. It is also the rarest. It is considered to be a marker disease for asbestos exposure. Mesothelioma is a cancer of the chest or abdominal cavity linings (mesothelium). If it occurs in the chest cavity, it is called pleural mesothelioma. If it occurs in the abdominal cavity, it is called peritoneal mesothelioma. By the time either cancer is diagnosed, it is almost always fatal and effective therapy does not currently exist.

There is no exposure threshold for mesothelioma. The exact mechanism of the disease remains unknown. Studies by eye appear to be at greater risk of getting mesothelioma but there a dose-response relationship seems to exist between asbestos exposure and mesothelioma. Like other diseases caused by asbestos exposure, mesothelioma often takes 30-50 years after initial exposure to develop.

OTHER DISEASES

Other diseases and adverse health effects have been observed in conjunction with asbestos exposure. Increased incidences of gastrointestinal cancers, including cancers of the esophagus, stomach, colon-rectum, kidney, and pancreas have been observed in populations exposed to asbestos.

Pleural plaque (thickening of the chest cavity lining) has also been observed among people exposed to asbestos. This condition does not have any symptoms nor does it require treatment.

APPENDIX A

EXAMPLE OF NOTIFICATION LETTER TO TENANTS

ASBESTOS NOTICE TO TENANTS OF:

Property Name: _____

Tenant: _____

In response to an environmental assessment that identified Asbestos-Containing Materials (ACM) and/or Pritreated Asbestos-Containing Materials (PACM) at the building, we have implemented a written Asbestos Operations and Maintenance (O&M) Program. This Program is designed to maintain all asbestos in the building in good condition and prevent conditions that could cause exposure to tenants and employees. Asbestos only presents a health hazard when fibers become airborne and are inhaled. The mere presence of ACM does not represent a health hazard. All ACM is inspected periodically and additional measures will be taken if needed to protect the health of building occupants. Cleaning and building staff are taking special precautions during their work to properly clean up any asbestos debris and to guard against disturbing ACM.

In accordance with our O&M Program, this building has been inspected for friable (easily crumbled) and non-friable materials which contain asbestos. Friable and non-friable ACM and PACM that is present in the tenant occupied or common areas of the building include the following:

Material Description	Location
Friable Materials	
PACM Wallboard and joint compound used and ceiling systems	These materials are installed in the Property in areas where work and ceiling material replacement, repairs, or renovations have been conducted.
PACM Pipe straight section insulation materials	When observed, asbestos-containing pipe insulation materials are replaced with non asbestos containing fiberglass. Nonetheless, sections of the original materials are still present, exposed in certain areas and concealed within fixed walls, ceilings, or chases. In certain accessible areas of the existing, these materials are generally concealed within fixed walls, ceilings, or chases.
PACM Pipe fitting elbows, valves, joints transition materials	These materials are located throughout the Property. (See the above comment for pipe straight section insulation materials)
Non-Friable Materials	
PACM 12" x 12" and ACM 9" x 9" vinyl floor tiles, sheet rock or flooring materials (linoleum), and mosaic and floor backing materials under these flooring materials.	These materials are applied within tenant units. Multiple layers may also be present.
PACM Floor backing and mosaic under parquet flooring	These materials are located throughout the Property.

Tenants will note that the inspection of these materials throughout the building by a licensed Asbestos Inspector did not identify any imminent threat exposure conditions. The ACM identified in and around the tenant areas can be maintained in-place through the proper implementation of an O&M Program without threat of exposure to building occupants.

As part of the O&M Program, Acacia Realty Trust is taking steps to notify the below listed persons of the presence, location and quantity of ACM and PACM at the work sites in the building:

- Prospective employers applying or bidding for work whose employees (if/when) can be expected to work in or adjacent to areas containing ACM/PACM.
- Employees of the owner who will work in or adjacent to areas containing ACM/PACM.
- All employees of employees who will be performing work within or adjacent to areas containing ACM/PACM.
- Employers of employees (contractors/tenants) who will occupy areas containing ACM/PACM.

Also as part of the O&M Program, we ask that all building tenants participate in the following:

- Do not disturb ACM/PACM.
- Report any evidence of disturbance or damage of ACM/PACM to The Property Program Manager (PPM).
- Report any dust or debris that might come from the ACM or suspect ACM, any change in the condition of the ACM/PACM, or any improper action (relative to ACM/PACM) of building personnel to The PPM.
- Prior to any maintenance activities, contracted maintenance activities, or other activities that may disturb any of the above-described materials or that will penetrate walls, fixed ceilings or suspended ceilings, the PPM will be notified for further instruction.

A copy of inspection, more detailed descriptions of materials and locations, and a copy of our O&M Program report are available from The PPM for the building. The PPM and ultimate personnel in charge for this building are as follows:

PPM: _____
(Name) (Title)

Building Manager: _____

Day time phone: _____

Pager: _____

24-Hour Emergency: _____

If there are any further questions regarding ACM in the building, please feel free to contact the PPM.

Please sign below and return a copy to the PPM in our records.

APPENDIX B

VERIFICATION OF EMPLOYER TRAINING

Verification of Employee Training

Employee Name: _____

Social Security #: _____

Position: _____

Training Provider: _____

Address: _____

Training Course Title: _____

Date of Course: _____

Length of Course (Hours): _____

Was this Course? Initial: _____ Under Training: _____

Does Course have full approval of U.S. Environmental Protection Agency? _____

Does Employee Participate in Respirator Program? Yes _____ No _____

Does Employee Participate in Medical Surveillance Program? Yes _____ No _____

Attach Copy of Certificate indicating Successful Completion of Training (including appropriate organization).

Signed: _____
(The Property Program Manager)

Date: _____

APPENDIX C

GLOSSARY

Acoustical Plaster Sound absorbing finishing material non-fibrous and formulated for application in areas where a reduction in sound reverberation or noise intensity is desired. These materials usually are applied in a thickness thickness of 3/4" to 1 1/2" thick. The finish material is applied over gypsum plaster, plaster lath or other base plaster. The surface material is usually finished and has a rough surface appearance.

Acoustic Tile Tile-shaped blocks of sound absorbing material used for ceilings or as wall facing. May be glued to substrate or laid in a 12x12 grid work.

ACM (ACBM) Asbestos-Containing Material (Asbestos-Containing Building Material) Any material containing more than one percent asbestos.

Adequately Wet Adequately Wet means sufficiently wet or penetrate with liquid to prevent the release of particulates. If visible emissions are observed coming from asbestos-containing material, then the material has not been adequately wetted. However, the absence of visible emissions is not sufficient evidence of being adequately wet.

AHERA Asbestos Hazard Emergency Response Act

AIA American Institute of Architects

Air Monitoring The process of measuring the fiber content of a specific volume of air.

Amended Water Water to which a surfactant has been added for use in wetting ACM to control asbestos fibers.

Asbestos Chrysotile, amosite, crocidolite, tremolite asbestos, anthophyllite asbestos, actinolite asbestos and any of these minerals that has been chemically treated under 29 CFR 1926.101.

Asbestos-Containing Waste Material Mill tailings or any waste that contains commercial asbestos and is generated by a source regulated under NESHAP. This term includes fibers from control devices, highly asbestos waste material, and bags or other ACM packaging contaminated with vermiculite asbestos. As applied to demolition and renovation operations, this term also includes regulated asbestos-containing waste and material contaminated with asbestos, including disposable syringes and needles.

Asbestos Audit Process of ACM that can be identified by color, texture or configuration of the building. If the data is determined by an accredited inspector to be ACM.

Asbestos Hazard Emergency Response Act (AHERA) An EPA regulation published in the October 30, 1987 Federal Register covering asbestos-containing materials in schools. AHERA requires local educational agencies to identify ACM in their schools, develop an asbestos management plan and implement this plan. An O&M program is also prohibited response action, where appropriate.

Asbestos O&M Work Cleaning, repair, replacement, repair or removal work involving asbestos-containing materials where the intent of the activity is not to remove asbestos. NESHAP requires that the owner or operator of a renovation or reconstruction activity conduct a thorough inspection of the affected facility or part of the facility where demolition or renovation will occur.

The Property Program Manager (PPM) A building owner or designated representative who supervises all aspects of the facility asbestos management and control program.

Breathing Zone A hemisphere forward of the worker with a radius of approximately 6' to 9' (1.8-2.7 m).

Bringing occupant An occupant that enters a structure from the surface of an area asbestos material.

CFR Code of Federal Regulations

Clerk-of-the-works A representative of the architect or owner who oversees construction, handles administrative matters, and ensures that the construction is in accordance with the contract documents.

Competent Person means, in addition to the definition in 29 CFR 1926.32 (b), one who is capable of identifying existing asbestos hazards in the workplace and selecting the appropriate control strategy for asbestos exposure, who has the authority to take prompt corrective measures to eliminate them, as specified in 29 CFR 1926.35(b); in addition, for Class I and Class II work, one who is specially trained in a training course which meets the criteria of EPA's Asbestos Accreditation Plan (40 CFR part 503) for renovation, or its equivalent used for Class III and Class IV work, who is included in a training curriculum with 1200 requirement for training of local education agency construction and building staff as set forth in 40 CFR 763.92 (c)(2).

Compliance Instruction (Compliance Directive) Instruction issued by OSHA to establish policies and provide clarification to ensure sufficient enforcement of OSHA standards.

Controlled Suspension or Controlled Spine Ceiling System A removable ceiling system, substituted by the area, consisting of exposed grid members. Tiles are typically 12" x 12" (300 x 300 mm) or 12" x 24" (300 x 600 mm) with slant or level cut on the edge of tiles for the purpose of accepting flat or "T" spines to support the tiles.

Confined Space A space that has limited openings for entry and exit, inadequate natural ventilation under a space not designed for continuous worker occupancy. Examples include boilers, tunnels, pits, sump tanks, manholes, silos, and utility vaults.

Critical Barrier One or more layers of polyethylene taped to place over openings into a work area. Openings to be covered include doors, windows, chimneys and any other opening that could allow asbestos air into a work area.

CSRF Construction Sciences Research Foundation

Decorative Acoustic Finish Finishing material non-fibrous and spray applied up to about 3/8" (10 mm) thick over gypsum wallboard. Material has a rough surface and is similar in appearance to acoustic plaster but is not designed for sound absorption.

Defamination: Separation of one layer from another.

Disposal Bag: Property labeled and used to collect and dispose of lead-paint plastic bags used for manipulating asbestos waste from work and to disposal site.

Drop Cloth: A layer of polyethylene on the floor of a work area to protect the floor below from contamination and to facilitate the cleanup of dust or debris generated during the work.

EJCDC: Engineers Joint Contract Documents Committee.

EL: See Excursion Limit.

Encapsulant: A material that surrounds or embeds asbestos fibers in an adhesive matrix, to prevent release of fibers.

Enclosure: The construction of an air-tight, impervious, partition barrier around asbestos-containing material to prevent the release of asbestos fibers into the air.

EPA: U.S. Environmental Protection Agency.

Excursion Limit (EL): The OSHA term used to define a maximum airborne concentration of asbestos in fibers per cubic centimeter as averaged over a sampling period of forty minutes.

Fiber Release: Any uncontrolled or unintentional disturbance of ACM that results in visible emission.

Fireproofing Material: Applied to structural elements or systems which provide increased fire resistance, usually varying in structural function. This material is typically applied using spray application.

Friable Asbestos (See "Regulated ACM").

Glassing: A polyethylene or polypropylene bag-like enclosure attached around an asbestos-containing waste (such as pipe, tank, etc.) to limit the physical contact with, and minimize release of asbestos fibers to the surrounding atmosphere.

HEPA Filter: High-Efficiency Particulate Air Filter. High filters are rated to capture at least 99.97% of all particles 0.3 microns or larger in diameter or larger.

HMR: Hazardous Material Rules under Dept. of Transportation regulations.

Initial Exposure Assessment: Done at the start of any work that may disturb ACM/ACBM; the PPM shall perform an assessment to determine the airborne concentrations of asbestos to which employees may be exposed. This assessment must be based on air monitoring results obtained using breathing zone air samples that are representative of the worker's EPA and OSHA time-weighted exposure of each employee. In addition, this assessment shall include consideration of all observations, information or calculations which indicate employee exposure to asbestos, including any previous monitoring conducted in the workplace, or of the operations of the employee which indicate the levels of asbestos asbestos likely to be encountered on-the-job.

MAP: EPA's Asbestos Final Model Assessment for ACM/ACBM for asbestos abatement worker training (40 CFR Part 703, Subpart B, and Appendix C).

Medical Surveillance: A periodic occupational review of a worker's health status. The required elements of an acceptable medical surveillance program are listed in the Occupational Safety and Health Administration standards for asbestos.

Mini-Enclosure: An enclosure constructed of polyethylene covering used for small scale, short duration asbestos maintenance or renovation work. Mini-enclosures can be made through to remain easy to the asbestos workers to enter without. Appendix C to OSHA regulation 29 CFR 1926.58 describes mini-enclosures and requirements for a change room for constructed enclosures in the mini-enclosure.

Miscellaneous: ACM listing asbestos-containing building material on structural components, structural finishes or finishes, such as floor and ceiling tiles, doors and window caulking, masonry or electrical systems insulation.

MEA: Negative Exposure Assessment.

Negative Exposure Assessment: A determination by the employer which complies with clause in Paragraph (c) (1) (ii) of the CFR 1926.110, that employee exposure during an operation is expected to be consistently below the PELs.

Negative Pressure System: A local exhaust system installed to prevent the escape of contaminated air to the surrounding environment. It includes HEPA filtration capable of maintaining a pressure differential with a lower pressure inside the Work Area than in any adjacent area. This system facilitates clean air under gravity's constant flow of air from adjacent areas into the work area.

Negative Pressure Respirator: A respirator in which the air pressure inside the respiratory mask wearing is positive during exhalation in relation to the air pressure of the outside atmosphere and negative during inhalation in relation to the air pressure of the outside atmosphere.

NESHAP: National Emission Standard for Hazardous Air Pollutants - EPA Rules under the Clean Air Act (40 CFR Part 61)

NIOSH: The National Institute for Occupational Safety and Health, which was established by the Occupational Safety and Health Act of 1970. Primary functions of NIOSH are to conduct research, evaluate workplace hazards, and develop programs.

O&M: Operations & Maintenance.

Operations & Maintenance (O&M) Program: a program of work practices to maintain ACM in good condition, ensure clean up of asbestos fibers previously released, and prevent further release by substituting and controlling ACM durability or damage.

Occupied Area An area where personnel are present and are performing their normal activities considered for the area (such as in a typical office area from 8:00 AM to 5:00 PM, Monday through Friday).

OSHA Occupational Health & Safety Administration.

PAPR Powered Air Purifying Respirator.

Protective Encapsulation An enclosure that is attached to the in situ substrate matrix without forming a discrete surface layer.

PPE Personal Protective Equipment.

Personal Air Sample An air sample taken with a sampling pump directly attached to the worker with the collecting filter and cassette placed in the worker's breathing zone. These samples are required by the OSHA asbestos standards and the EPA Worker Protection Rule.

PCM Phase Contrast Microscopy.

Phase Contrast Microscopy (PCM) A method of analysis using a light microscope, used to find the concentration of airborne fibers. Does not distinguish among asbestos and other fibers. Used by OSHA to find personal exposures and by EPA in final rule level for AHERA project closures.

Pleural Any space to convey air in a building or structure. The space above a suspended ceiling is often used as an air plenum. This term is also used in the work practices to refer to spaces above a ceiling and used to convey air.

PLM Polarized Light Microscopy.

Polarized Light Microscopy (PLM) A method of analysis using a light microscope to find the elemental or mineral types of samples, including the concentrations of asbestos in both materials. Used by EPA for AHERA and NSRHP and by OSHA to see if asbestos is involved in a project.

Project Representative, Architect's representative at the project site who works in the administration of the construction contract.

Protection Factor The ratio of the ambient concentration of an airborne substance to the concentration of the substance inside the respirator in the breathing zone of the wearer. The protection factor is a measure of the degree of protection provided by a respirator in the field.

RCA Resource Conservation and Recovery Act.

RACM Regulated ACM.

Regulated ACM (RACM) As defined by NSRHP in the November 30, 1990 Federal Register, regulated asbestos-containing material (RACM) means any friable asbestos material (by Category I nonfriable ACM this has become friable, i.e., Category I contains ACM that will be or has been subjected to sanding, grinding, cutting, or abrading, or to Category II nonfriable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder by the forces expected to act on the material in the course of demolition or renovation operations regulated by this subpart.

(Note: Regulated ACM is an EPA NSRHP concept. OSHA makes no distinction between friable and non-friable asbestos.)

"Cutting" means to pass over with a sharp-edged instrument and includes sawing, but does not include shearing, slicing or planing.

"Grinding" means to reduce powder or small fragments and includes sandpaper stripping or grinding.

Friable asbestos material means any material containing more than 1 percent asbestos as determined using the method specified under AHERA and LTR Part 903, Subpart D, Appendix A - section 1, Polarized Light Microscopy that, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure. If the asbestos content is less than 10 percent as determined by a method other than point counting by polarized light microscopy, PLM, verify the asbestos content by point counting using PLM.

Category I nonfriable asbestos-containing material (ACM) means asbestos-containing putty, gaskets, resilient floor covering and asphalt roofing products containing more than 1 percent asbestos as determined using the method specified under AHERA.

Category II nonfriable ACM means any material, excluding Category I nonfriable ACM, containing more than 1 percent asbestos as determined using the methods specified under AHERA, when dry, cannot be crumbled, pulverized, or reduced to powder by hand pressure.

Remove As Operations and Maintenance work on ACM. "remove" refers to the removal of ACM as needed to perform a maintenance or repair O & M activity.

Removal Encapsulant A proprietary encapsulant specifically designed to stabilize fiber release during removal of asbestos-containing materials under Part 115 asbestos rule.

Repair/Resurfacing Damaged ACM is an unregulated activity so an owner has to do to prevent fiber release.

Respirator A device designed to protect the wearer from the inhalation of harmful particulates.

Short-cycle, Short-duration Term usually used by OSHA to describe ACM work activities on the property OSHA construction standards. This term has been superseded by the new OSHA definitions in the current OSHA standard.

Surfacing ACM Abrasive-containing material that is sprayed on, bonded on or otherwise applied to surfaces, such as acoustic panels in ceilings and suspended acoustics on structural members of other materials or surfaces for acoustic, fireproofing, or other purposes.

Survey An asbestos survey is what EPA calls an inspection in the AHERA regulation. It consists of a visual and tactile inspection of a building to identify, quantify and assess the accessibility and condition of the ACM and suspected ACM present.

Suspended "T" Bar Ceiling System A false or dropped ceiling composed of acoustic tiles held into an overhead metal "T" bar grid frame suspended by wires from building framing members.

Surfactant A chemical wetting agent added to water to improve penetration, thus reducing the quantity of water required for a given quantity of area.

TEM Transmission Electron Microscopy

Temporary Barriers One or more layers of 6 mil polyethylene installed to contain a work area from other portions of a facility.

Thermal System Insulation (TSI) Thermal system insulation - asbestos-containing material applied to pipes, boilers, tanks, breeching, tanks, ductwork or other interior mechanical components to prevent heat loss or gain or water condensation.

Time Weighted Average (TWA) In air sampling, this refers to the average air concentration of contaminants during a particular time period.

TSI Thermal System Insulation

Transmission Electron Microscopy (TEM) A method of analysis using an electron microscope, used to find and analyze the composition of asbestos or bulk asbestos fibers and structures. Disaggregates among asbestos and other materials; can detect smaller asbestos fibers than does PCM. Used by EPA to find asbestos concentrations by large AHERA project clearance.

TSCA Toxic Substances Control Act

TWA Time Weighted Average

Work Area The area where asbestos-related work or removal operations are performed which is clearly and/or physically protected from spread of asbestos dust, fibers or debris, and entry by unauthorized personnel.

Work Practices Procedures designed to be followed to avoid or minimize fiber release during activities affecting ACMs

1.0 INVITATION TO BID

Qualified Asbestos Removal Contractors are invited to submit bids to accomplish the removal and disposal of asbestos-containing roofing components, floor tiles, floor tile mastic, cooling tower fill, cooling tower drift eliminator, boiler insulation, spray applied fire proofing, roofing wall and duct tar as specified within the enclosed bid specifications, drawings and walkthrough.

The work is to be accomplished for Acadia-PA Sherman Avenue LLC, ACS8 Inc, and Acadia Realty LP referred to hereafter as the "Owner." The Owner is located at 1311 Mamaroneck Avenue in White Plains, New York 10605, throughout the following location:

Sherman Plaza
4650 Broadway
New York, New York

CNS Management Corp. (CNS) shall be the Owner's Environmental Consultant for this project. CNS shall conduct compliance inspections and monitoring of the work performed by the asbestos removal contractor. Bidder will be required to attend a Pre-Bid meeting where it is expected that they will familiarize themselves with the work. The bidders shall be given ample time to accomplish this familiarization through inspection. Failure of the bidder to do so shall not be cause for additional compensation to the contractor.

Bid Forms shall be submitted in a sealed envelope and delivered sealed before 3:00 p.m. on Friday, July 20, 2007. Owner Bid forms with Bid Instructions are enclosed within this section.

BID FORM

1. The undersigned, CH2M HILL, having familiarized themselves with the *Specifications, Drawings, Invitation to Bid, Instructions to Bidders, Bid Form, General Conditions and Walkthrough* affecting the cost of work for:

Owner Acadia-P/A Sherman Avenue, LLC

Address: 4650 Broadway, New York, New York

And having examined the site hereby propose to furnish all material, tools, equipment and incidentals necessary to perform all work as specified, in acceptance with the Owner for the **Total Bid Price of (\$ _____)**.

2. The above noted Total Bid Price is to be broken down as follows:

- 1) All Federal, State, Local permits; fees, notification and variance costs.

Cost for Item # 1-\$ 55200.00

- 2) All costs associated with removal and disposal of asbestos containing roof membrane, roof flashing, and wall and duct tar from the roof.

Cost for Item # 2-\$ 450,000

- 3) All costs associated with removal and disposal of asbestos containing cooling tower fill, drift eliminator and pipe insulation from the roof level.

Cost for Item # 3-\$ 20,000

- 4) All costs associated with removal and disposal of asbestos containing vinyl floor tiles with black mastic and pipe insulation from the 2nd floor.

Cost for Item # 4-\$ 210,000

- 5) All costs associated with removal and disposal of asbestos containing vinyl floor tiles with black mastic, pipe insulation and spray-applied fire proofing from the 1st floor.

Cost for Item # 5-\$ 300,000

- 6) All costs associated with removal and disposal of asbestos containing boiler insulation from the basement level.

Cost for Item # 6-\$ 80,000

- 7) All costs associated with removal and disposal of asbestos containing pipe insulation from the basement level.

Cost for Item # 7-\$ 210,000

3. The undersigned agrees to commence work 14 days upon bid award date and time as specified by Owner, to complete each work within the specified number of calendar day(s).

4. The undersigned agreed that **this proposal shall remain in force and effect for a period of not less than 45 calendar days following the bid opening date.** It is understood and agreed that the owner reserves the right to reject any or all proposals, to waive any informal ties in bidding and to hold all proposals for the above noted period of time.

5. Selection of Subcontractors is subject to The Owner's review prior to awarding of contract.

6. It is herewith noted that Owner will not accept any cost extras due to field conditions. It is the undersigned (Contractor) responsibility to familiarize themselves with the project during walkthroughs, specifications and drawings. Additional site visits may be pre-arranged with Owner.

7. All extra work must be written up by the Contractor in the form of a change or field order. Indicated on it must be a firm price or not to exceed time for the work. All change orders must be submitted to the Project Manager for approval prior to the commencement of work.

8. All work is to be performed during normal work time hours unless proper arrangements are made.

9. All construction to be executed in such a manner as not to interfere with the normal everyday operation of the mall.

10. We the contractor will comply with insurance requirements as mandated by The Owner's Risk and Insurance Department.

11. We shall remove all debris, clean and polish all surfaces and leave all the affected floors in broom swept condition.

12. Any moving of existing equipment and furniture within the space necessary to accommodate the aforementioned project will be the Contractor's responsibility.

13. List of documents forming the basis of the bid package:

- Asbestos Abatement Procedures supplied by Owners Environmental Consultant
- Walkthrough provided by Owners Environmental Consultant
- Additional pre-arranged site visits and/or walkthroughs
- Specification and drawing addendums if applicable

14. Exceptions

NO TEMPORARY PROTECTION, REGULATION, REPLACEMENT, REINSTALLATION, WATER & ELECTRIC MUST BE AVAILABLE IN THE BUILDING, ANY OSHA DOT PERMITS, SCAFFOLDING SIDEWALK BRIDGES, DE OR ARCHITECT.

15. All Bid Packages are to be enclosed with the following items:

- a) The schedule that reflects calendar day's duration for the asbestos removal.
- b) Copy of insurance certificate naming Aradia-P/A Sherman Avenue LLC as the certificate holder and ACRS Inc, Aradia Realty LP and CNS Management Corp as additional insured.
- c) When awarded, the undersigned will be requested to submit a notarized original Indemnification Agreement.
- d) A copy of your New York State Company Asbestos License.
- e) A list of proposed waste haulers and disposal sites with permits.
- f) A list of references. These references should be for work completed within the past 18 months.
- g) When awarded, the undersigned will be requested to submit a copy of their Haz-Com, respiratory protection, emergency response and asbestos removal standard operating procedures.
- h) Material safety data sheets and Equipment Specifications for materials and machinery to be used in accomplishing all phases of work.
- i) Failure to provide the above information may cause for the disqualification of the undersigned's bid package.

16. Bid are to include the following items and related costs, but not limited to: labor, removal, disposal, permits, fees, mobilization, transportation, disposal fees, dumpsters, insurance's, taxes, tools, services, equipment, hoisting, supervision, filing fees, and any and all including incidentals to complete all required asbestos work for a complete scope. All work to conform to all state, local and all regulatory agencies, having jurisdiction, the owner(s) and their agents.

17. All unit costs and labor rates shall include all applicable taxes, overtime, overhead profit, miscellaneous tools, insurance's, benefits, etc., for a complete cost.

This bid package is submitted by:

Firm: ARADIA REALTY LP & CNS MANAGEMENT, INC

Date: 11/26/2007

INSTRUCTIONS TO BIDDERS**BID FORM**

- a) All Bids must be submitted on the *Bid Form* furnished, herewith, which shall be completed as a formal document in its entirety.
- b) Exceptions to any of the items on the *Specifications* shall be clearly noted by the *Bidder* as exceptions.
- c) *Owner* may consider as informal any *Bid*, which contains an alteration or a departure from the *Bid Form*, enclosed *Specifications* and *Drawings* other than specified.
- d) *Bid Documents*, submitted by all *Bidders*, shall be enclosed in outer and inner envelopes, both of which shall be sealed and clearly labeled with the words, "*Bid Documents*".
- e) *Owner* will neither consider nor accept any *Bid*, which is received after the time established for the receiving of same.
- f) *Owner* reserves the right to waive any information in *Bidding* or to reject any and all *Bids*.
- g) The award of the contract will be made within five (5) days after opening of the *Bids*.
- h) The *Contract* will be based upon the completion of the work according to the *Specifications*.
- i) The *Owner* reserves the right to award all or part of the requested services to one or more contractors, to reject any or all bids, to negotiate changes in the scope of work or services to be provided, and to otherwise waive all technicalities, as the owner deems to be in their best interest.

2.0 Introduction

The scope of work in this document is for the removal of asbestos containing materials for the Owner at the office building located at 4650 Broadway in New York, New York. The purpose of this document is to define the asbestos abatement scope of work. Any changes to this scope shall be submitted by the bidder in writing with their bid.

Materials identified as asbestos containing within the asbestos survey are outlined in the below table by location of the asbestos containing material with an estimated quantity.

Location	Material	Quantity	Drawing	Abatement Procedure
Roof Level				
Roof	Roof membrane & flashing	65,189 SF	AR-3	Attachment PR & R
Roof	Wall & Duct Tar	1,500 SF	AR-3	Attachment PR & R
Roof	Cooling Tower Fill & Drift Eliminator	192 SF	AR-3	Attachment F & R
Roof	Pipe Insulation	130 LF	AR-3	Attachment T & R
Basement Level				
Boiler Room	Boiler Insulation	1,260 SF	AR-4	Full Containment
Parking Area	Pipe Insulation	5,010 LF	AR-4	Attachment T & R
Tenant Floors				
1 st Floor	9"x9" VVT with ACM black mastic under 12"x12" VVT	64,135 SF	AR-1	Attachment VA
1 st Floor	Pipe Insulation	730 LF	AR-1	Attachment VA
1 st Floor	Spray-applied fire proofing	4,264 SF	AR-1	Attachment VA
2 nd Floor	9"x9" VVT with ACM black mastic	64,135 SF	AR-2	Attachment VA
2 nd Floor	Pipe Insulation	730 LF	AR-2	Attachment VA

All quantities are to be field verified via walkthroughs by the bidder; the bidder will not receive any change orders for additional quantities found during the project and will receive penalties for any discrepancies in work based upon extras and specification changes.

3.0 General Conditions

The Contractor (referred to hereafter as bidder) is solely responsible for supplying all costs and burden associated with permitting, qualified labor, materials, disposal and equipment necessary to perform the work required to successfully complete this project in compliance with this specification.

3.0.1 The bidder is required to submit the following documents with their bid package:

- a) A valid copy of the bidder's State of New York Department of Labor Company Asbestos License;
- b) A Certificate of Insurance with a minimum policy of \$5,000,000.00 general aggregate with \$5,000,000.00 for each occurrence; insurance certificates; the awarded bidder must list specific entities as additional insured and certificate holders.
- c) A copy of the bidder's Health and Safety Plan.

3.0.2 Bidder shall maintain a safe, clean and orderly work site, with the proper postings as per all Federal, State and Local Ordinances and Laws. The Bidder shall erect and maintain isolation barriers, warning signs and all other means for protection / warning to ensure maximum safety.

3.0.3 The Bidder shall not permit any condition to exist or engage in any practice that would result in a hazardous or a potentially hazardous condition for the building occupants, including but not limited to the tenants, Owner's employees, or the bidder's work force.

3.0.4 Bidder shall maintain harmonious labor throughout the project.

3.0.5 If the successful bidder fails to execute the contract within fourteen (14) days of award, the Owner, at his option may consider the bid and the acceptance of it to be null and void due to abandonment of the project by the bidder.

3.0.6 No changes in work are authorized or considered valid unless the Owner has signed a Change Order directing this change.

3.0.7 The Environmental Consultant will be on site at all times when work is in progress to assure compliance with all regulations and these specifications. The Environmental Consultant shall inspect the work at least once per work shift. The Environmental Consultant shall keep the Owner informed of the progress of the work based on his observations and will endeavor to guard the Owner against defects and deficiencies in the work.

3.0.8 Owner's property that is to remain in place shall be protected. If damaged by the Bidder, the Bidder shall, at Owner's discretion, either replace damaged items or reimburse the Owner for replacement at no cost to the Owner.

3.0.9 The Bidder may be back charged at the Owner's discretion for all costs associated with failure to meet the scheduled completion date. This cost shall include, but will not be limited to: Consultant's fees, loss of rental income, management charges, etc.

3.0.10 The Bidder shall take all precautions to protect his workmen, as per USEPA, OSHA, New York State and New York City Regulations.

- 3.0.11 The Bidder shall be responsible for payment of all royalties and licenses required to accomplish his work. The Bidder shall hold the Owner, Owner's agent and the Consultant harmless from any damages, losses, and other expenses arising from all suits or claims for violations, infringement on any patent rights or from negligence of work. The Bidder shall be responsible for notifying the Owner and/or Consultant if he has a reason to believe that a product specified a process or design is an infringement of a patent so that an alternate method / product may be considered if feasible.
- 3.0.12 The Bidder will Hold Harmless and assumes all responsibility with regard to any and all violations pertaining to the asbestos removal project(s).
- 3.0.13 Any delay caused in any part by the asbestos abatement contractor that impacts the starting the project on time, completing phasing end dates during the project and/or completing the project at it's designated end date will result in assessed penalties imposed by the owner against the asbestos abatement contractor.
- 3.0.14 The Bidder's application for final payment shall include the following items:
- a) Copy of Bidder's New York Asbestos License.
 - b) Copy of Bidder's Insurance Certificate.
 - c) Copy of Notifications and Variances.
 - d) Completed Waste Manifests.
 - e) Copy of Workers' New York State and New York City Asbestos Licenses and Medicals.
 - f) Copies of Daily Logs and Daily Sign-In/Out Sheets.
 - g) Copy of OSHA Air Sampling Results
 - h) Copy of Waste Transporter's and Landfill Permits
 - i) Copy of Landfill / Disposal Facility Manifests

The above items shall be submitted to the Consultant for verification and approval.

4.0 Asbestos Removal - General

Bidder shall submit a project approach with their bid submittal, the project approach shall conform to these specifications, if changes are to be made to these specifications the bidder will outline these changes within their bid package for review.

The owner will be conducting air monitoring throughout the project, the bidder will have the on-site air monitor do visual inspections of the completed area(s). In addition all work area(s) shall be maintained and remain intact until the air monitor has notified the bidder to dismantle any work area(s).

- 4.0.1 The owner will provide water and electricity to the site.
- 4.0.2 The bidder will have a Ground Fault Circuit Interrupter (GFCI) panel delivered to the site, a minimum, 2 days prior to the start of the project.
- 4.0.3 The bidder is required to have the following items posted on site throughout the duration of the project: Bidder Health and Safety Plan; EPA NESHAP 40 CFR Part 61 subparts A & M; OSHA Construction Standard 29 CFR 1926.1101; Chapter 469, New York State Department of Labor Industrial Code Rule 56 and New York City Department of Environmental Protection Title 15 Chapter 1 Attachments FR & R, and project notifications, licenses and worker certificates.
- 4.0.4 The decontamination facility will be fully constructed and operational at each work area(s) prior to asbestos removal activities taking place. All polyethylene sheeting will be 6-mil opaque, fire-retardant polyethylene sheeting with reinforced polyethylene sheeting for the decontamination floor.
- 4.0.5 All abatement activities are to be followed as indicated by this specification and all Federal, State and Local Laws. The Bidder Holds Harmless and assumes all responsibility with regard to any and all violations.
- 4.0.6 All asbestos debris is to be immediately placed in black 6-mil waste bags that are clearly marked with all appropriate signage under EPA and New York State and New York City regulations. Waste will not be allowed to accumulate inside the work area.
- 4.0.7 Waste bags are to be kept in an already established holding area, inside an on-site roll-off container or to be removed off-site when filled. No more than 40 cubic yards of waste will be stored for a period of more than 72 hours and waste bags are to be removed via winch and load. Note: waste manifests shall be provided for each pick up to the consultant prior to leaving the site.
- 4.0.8 If during abatement air sample results are reported above 0.01 f/cc, then clearance air samples will be required to be collected and analyzed. Once clearance air sampling results are reported by the laboratory to CNS, the bidder will be notified and allowed to breakdown.

4.0.9 The substrates will be encapsulated once final clearance results are received from the laboratory.

4.1 Asbestos Removal – Full Containment Procedures

Full containment procedures as outlined in NYSIDOL KCR-56 and NYCDEP Title 15 Chapter 1 shall be strictly adhered to by the contractor. Full containment procedures are to be followed for the removal of ACM boiler insulation from the boiler room. Estimated quantities and locations are noted within the table of Section 1.0 of this document and project drawings.

4.1.0 The work area will be cordoned off with associated warning signs, the GFI Panel will be connected to the building power and all electric will be locked out and tagged out prior to decontamination construction.

A worker and waste decontaminated facility will be constructed and operational at each work area prior to asbestos removal activities and made operational prior to any work area preparation activities.

4.1.1 Background, Pre-abatement, During Abatement and Clearance Air samples will be collected during all phases unless indicated by Site Specific Variance.

4.1.2 Bidder shall not breakdown work area(s) until a final visual and clearance air sample results are below 0.01 fibers per cubic centimeter (f/cc).

4.1.3 In the event air sample analysis exceed 0.01 f/cc during the project all work shall cease and proper repairs and/or cleaning shall be completed by the bidder; repairs include but are not limited to wet wiping area(s) designated by CNS Management, equipment replacement and/or HEPA filter replacement. Multiple air sample failures shall not be cause for bidder to receive extra(s), project penalties from Owner will be issued if schedule is exceeded.

4.1.4 Negative Exhaust Units will be placed inside the work area; exhaust ducts will be run to a manifold and exhausted outside the building. Negative pressure shall be established and maintained at -0.02" water column through the project.

4.1.5 The work area shall be pre-cleaned, utilizing wet methods and HEPA-vacuuming.

4.1.6 The work area will be plasticized with opaque, 6 mil fire retardant polyethylene sheeting.

4.1.7 The environmental consultant shall inspect the work area once preparation activities have been completed and prior to removal activities.

4.1.8 All asbestos materials will be maintained wet during removal, and once removed from the substrate, placed directly in labeled 6 mil polyethylene waste bags.

4.1.9 Asbestos waste will not be allowed to accumulate in quantities greater than 60 cubic yards on site. Waste containers will be hard walled and hard topped and be lined with 2-layers of fire retardant 6-mil polyethylene sheeting.

4.1.10 All generated asbestos waste shall be disposed of as asbestos containing. Note: waste manifests shall be provided for each pick up to the consultant prior to leaving the site.

4.2 Asbestos Removal - Site Specific Variances

Use of New York City Department of Environmental Protection Attachments (FK, R, TM and VA) for a Site Specific Variance will be utilized for the project. All procedures outlined in the Site Specific Variance will be adhered to by the contractor. Any fines incurred by the owner due to the asbestos abatement contractor actions will be the responsibility of the asbestos abatement contractor.

The Site Specific Variance will be prepared by CNS Management Corp and will be the responsibility of the contractor to file the ACP-9.

4.2.1 Asbestos Removal - Attachments FB & R - ACM Roofing Materials

The abatement contractor is requesting a variance to perform the removal of the roofing ACM's by foam procedures utilizing remote worker and waste decontamination facilities. The asbestos abatement project for the roof will be completed in one phases, with the worker and waste decontamination facilities being constructed on roof.

The abatement contractor requests relief from the following subsections for the removal of the roofing materials:

- | | |
|---------------------|--|
| 1-41(c) | During abatement air sampling inside the work area |
| 1-41(f) | No post abatement clearance air monitoring |
| 1-81(j) | Not to pre-clean the work area |
| 1-81(m) | Partial plasticization of the work area |
| 1-82(a) & 1-83(a) | Remote worker and waste decontamination facilities |
| 1-91 | Engineering controls |
| 1-102(b) | Not to saturate ACM material with water |
| 1-112(f) & 1-112(e) | No settling periods or 2 nd & 3 rd cleanings |

Prior to commencing removal activities, The abatement contractor will remote construct the worker and waste decontamination facilities on the sixth floor of the building as described in Attachment R. Please see the attached drawing for the exact location of the decon facilities. The roofing materials will be coated with a minimum 1" of foam.

The foam will remain on the material for the duration of the removal activities. Roofing materials will be removed by manual methods or HEPA Equipment power tools and will be immediately bagged in compliance with Attachment FB. Upon completion of the removal, the work area will be thoroughly cleaned. The removal will be performed in accordance with

attachments III & R. Background, pre-abatement and during air samples will be collected and analyzed by PCM methods for the project.

4.2.2 Asbestos Removal - Attachment IV - ACM Flooring Materials

The abatement contractor is requesting a variance to perform the removal of the flooring ACM's by foam procedures as outlined in Attachment IV. The asbestos abatement project for the flooring materials will be completed on the first and second floors.

The abatement contractor requests relief from the following subsections for the removal of the floor tiles and associated mastic:

- | | |
|---------------------|--|
| 1-81(d) | No post abatement clearance air monitoring |
| 1-81(j) | Not to pre-clean the work area |
| 1-81(m) | Partial plasticization of the work area |
| 1-91(c) & (g) | Engineering Controls |
| 1-102(b) | Not to saturate ACM material with water |
| 1-112(d) & 1-112(e) | No settling periods or 2 nd & 3 rd cleanings |

Prior to commencing removal activities, the abatement contractor will construct the worker and waste decontamination facilities on the ground floor of the building. Please see the attached drawing for the exact location of the decont facilities. The work area will be partially plasticized, up 5 feet on the walls. Negative exhaust units will be placed inside the work area to establish negative pressure inside the containment area. The exhaust ducts will be exhausted to the outside of the building and monitored. The flooring materials will be coated with a minimum 1"-3" of foam. The foam will remain on the material for the duration of the removal activities. Flooring materials will be removed by manual methods and will be immediately bagged in compliance with Attachment IV. Upon completion of the removal, the work area will be thoroughly cleaned. The removal will be performed in accordance with attachment IV. Background, Pre-abatement and during abatement air samples will be collected and analyzed by PCM methods for the project.

4.2.3 Asbestos Removal - Attachment VA - ACM Flooring Materials & Pipe Insulation within the Same Work Area

The abatement contractor is requesting a variance to perform the removal of the flooring ACM's by foam procedures with pipe insulation within the same work area as outlined in Attachment VA. The asbestos abatement project for the flooring materials will be completed on the first and second floors.

The abatement contractor requests relief from the following subsections for the removal of the floor tiles and associated mastic:

- | | |
|---------|---|
| 1-81(m) | Partial plasticization of the work area |
|---------|---|

Isolation barriers shall be installed with 2 layers of 6-mil plastic sheeting sealed with tape and or caulked for air tightness. The number of air changes required for during abatement shall be increased to 6. The walls of the work area shall be plasticized with two layers of 6-mil plastic sheeting. The asbestos pipe insulation shall be removed first by employing wet methods. A visual inspection shall be conducted by the asbestos supervisor and project monitor in order to ensure the absence of debris on the floor. VAT removal shall not begin until at least one hour after the visual inspection in order to decrease the fiber concentration inside the work area. The floor tiles will be removed by utilizing foam methods as detailed in Attachment IV. Once the removal of the floor tiles is completed a three phase cleaning as detailed in section 1-112, employing a 12 hour, a 4 hour and a minimum 1 hour waiting/settling periods will be adhered to and then followed by clearance air monitoring.

4.2.4 Asbestos Removal - Attachment E - ACM Ceiling Tower Fill Material

The abatement contractor is requesting a variance to perform the removal of asbestos containing fill material from the roof top cooling tower as outlined in Attachment F.

The abatement contractor requests reliefs from the following subsections for the removal of the cooling tower fill material:

- | | |
|---------|---|
| 1-81(n) | Partial plasticization of the work area |
| 1-91(c) | Engineering Controls |

A Remote worker and waste decontamination facility will be established on the roof level, adjacent to the cooling tower. Isolation barriers shall be installed with 2 layers of 6-mil plastic sheeting sealed with tape and or caulked for air tightness. The floor of the work area shall be plasticized with two layers of 6-mil polyethylene sheeting. The exterior of the cooling tower (except for the entrance) shall be plasticized with two layers of 6-mil polyethylene sheeting and an additional layer of 6-mil reinforced polyethylene sheeting. Negative pressure equipment shall be installed and operated during the entire project until clearance air sampling is completed. The work area shall be smoke tested daily to ensure there are no stagnant points in the work area. Once the removal of the cooling tower fill material is completed a three phase cleaning as detailed in section 1-112, employing a 12 hour, a 4 hour and a minimum 1 hour waiting/settling periods will be adhered to then followed by clearance air monitoring.

4.2.5 Asbestos Removal - Attachment T - Glovebag Procedures Inside Tent Enclosure

The abatement contractor is requesting a variance to perform the removal of pipe insulation as outlined in Attachment T. The asbestos abatement project for the pipe insulation materials will be completed on the basement and roof level.

The abatement contractor requests relief from the following subsections for the removal of the pipe insulation:

- | | |
|---------|---|
| 1-81(n) | Partial plasticization of the work area |
|---------|---|

Isolation barriers shall be installed with 2 layers of 6-mil plastic sheeting sealed with tape and or caulked for air tightness. The number of air changes required for during abatement shall be increased to 6. The walls of the work area shall be plasticized with two layers of 6-mil plastic sheeting. The asbestos pipe insulation shall be removed first by employing wet methods. A visual inspection shall be conducted by the asbestos supervisor and project monitor in order to ensure the absence of debris on the floor. VAT removal shall not begin until at least one hour after the visual inspection in order to decrease the fiber concentration inside the work area. The floor tiles will be removed by utilizing foam methods as detailed in Attachment FV. Once the removal of the floor tiles is completed a three phase cleaning as detailed in section 1-112, employing a 12 hour, a 4 hour and a minimum 1 hour waiting/settling periods will be adhered to and then followed by clearance air monitoring.

1.0 INVITATION TO BID

Qualified Asbestos Removal Contractors are invited to submit bids to accomplish the removal and disposal of asbestos-containing roofing components, floor tiles, floor tile mastic, cooling tower fill, cooling tower drift eliminator, boiler insulation, spray applied fire proofing, roofing wall and duct tar as specified within the enclosed bid specifications, drawings and walkthrough.

The work is to be accomplished for Acadia-P/A Sherman Avenue LLC, ACRS Inc, and Acadia Realty LP referred to hereafter as the "Owner." The Owner is located at 1311 Mainstreet Avenue in White Plains, New York 10605, throughout the following location:

Sherman Plaza
4650 Broadway
New York, New York

CNS Management Corp. (CNS) shall be the Owner's Environmental Consultant for this project. CNS shall conduct compliance inspections and monitoring of the work performed by the asbestos removal contractor. Bidder will be required to attend a Pre-Bid meeting where it is expected that they will familiarize themselves with the work. The bidders shall be given ample time to accomplish this familiarization through inspection. Failure of the bidder to do so shall not be cause for additional compensation to the contractor.

Bid Forms shall be submitted in a sealed envelope and delivered on or before **12:00pm** on **Wednesday, November 7, 2007** to **Mr. Elias Slafky**. Owner Bid forms with Bid Instructions are enclosed within this section.

BID FORM

1. The undersigned, _____, having familiarized themselves with the *Specifications, Drawings, Invitation to Bid, Instructions to Bidders, Bid Form, General Conditions and Waiver/Requests* affecting the cost of work for:

Owner: Acadia P/A Sherman Avenue, LLC

Address: 4650 Broadway, New York, New York

And having examined the site hereby propose to furnish all material, tools, equipment and incidentals necessary to perform all work as specified, in acceptance with the **Owner** for the **Total Bid Price** of: (\$ _____).

2. The above noted Total Bid Price is to be broken down as follows:

- 1) All Federal, State, Local permits, fees, notification and variance costs.

Cost for Item # 1-\$ \$5200.00

- 2) All costs associated with removal and disposal of asbestos containing roof membrane, roof flashing, and wall and duct tar from the roof.

Cost for Item # 2-\$ _____

- 3) All costs associated with removal and disposal of asbestos containing cooling tower fill, drift eliminator and pipe insulation from the roof level.

Cost for Item # 3-\$ _____

- 4) All costs associated with removal and disposal of asbestos containing vinyl floor tiles with black mastic and pipe insulation from the 2nd floor.

Cost for Item # 4-\$ _____

- 5) All costs associated with removal and disposal of asbestos containing vinyl floor tiles with black mastic, pipe insulation and spray-applied fire proofing from the 1st floor.

Cost for Item # 5-\$ _____

- 6) All costs associated with removal and disposal of asbestos containing boiler insulation from the basement level.

Cost for Item # 6-\$ _____

- 7) All costs associated with removal and disposal of asbestos containing pipe insulation from the basement level.

Cost for Item # 7-\$ _____

3. The undersigned agrees to commence work 14 days upon bid award date and time as specified by Owner, to complete such work within the specified number of calendar day(s).
4. **The undersigned agreed that this proposal shall remain in force and effect for a period of not less than 45 calendar days following the bid opening date.** It is understood and agreed that the owner reserves the right to reject any or all proposals, to waive any informal ties in bidding and to hold all proposals for the above noted period of time.
5. Selection of Subcontractors is subject to The Owner's review prior to awarding of contract.
6. It is herewith noted that Owner will not accept any cost extras due to field conditions. It is the undersigned (Contractor) responsibility to familiarize themselves with the project during walkthroughs, specifications and drawings. Additional site visits may be pre-arranged with Owner.
7. All extra work must be written up by the Contractor in the form of a change or field order. Indicated on it must be a firm price or not to exceed time for the work. All change orders must be submitted to the Project Manager for approval prior to the commencement of work.
8. All work is to be performed during normal **work time** hours unless proper arrangements are made.
9. All construction to be executed in such a manner as not to interfere with the normal everyday operation of the mill.
10. We the contractor will comply with insurance requirements as mandated by The Owner's Risk and Insurance Department.
11. We shall remove all debris, clean and polish all surfaces and leave all the affected floors in broom swept condition.
12. Any moving of existing equipment and furniture within the space necessary to accommodate the aforementioned project will be the Contractor's responsibility.
13. List of documents forming the basis of the bid package:
 - Asbestos Abatement Procedures supplied by Owners Environmental Consultant
 - Walkthrough provided by Owners Environmental Consultant
 - Additional pre-arranged site visits and/or walkthroughs
 - Specification and drawing addendums if applicable
14. Exceptions

15. All Bid Packages are to be enclosed with the following items:

- a) The schedule that reflects calendar day's duration for the asbestos removal.
- b) Copy of insurance certificate naming Acadia-P/A Sherman Avenue LLC as the certificate holder and ACBS Inc, Acadia Realty LP and CNS Management Corp as additional insured.
- c) When awarded, the undersigned will be requested to submit a notarized original Indemnification Agreement.
- d) A copy of your New York State Company Asbestos License.
- e) A list of proposed waste handlers and disposal sites with permits.
- f) A list of references. These references should be for work completed within the past 18 months.
- g) When awarded, the undersigned will be requested to submit a copy of their Haz-Com, respiratory protection, emergency response and asbestos removal standard operating procedures.
- h) Material safety data sheets and Equipment Specifications for materials and machinery to be used in accomplishing all phases of work.
- i) Failure to provide the above information may cause for the dismissal of the undersigned's bid package.

16. Bid are to include the following items and related costs, but not limited to: labor, removal, disposal, permits, fees, mobilization, transportation, disposal fees, dumpsters, insurance's, taxes, tools, services, equipment, hoisting, supervision, filing fees, and any and all including incidentals to complete all required asbestos work for a complete scope. All work to conform to all state, local and all regulatory agencies, having jurisdiction, the owner(s) and their agents.

17. All unit costs and labor rates shall include all applicable taxes, overtime, overhead profit, miscellaneous tools, insurance's, benefits, etc., for a complete cost.

This bid package is submitted by:

INSTRUCTIONS TO BIDDERS

BID FORM

- a) All *Bids* must be submitted on the *Bid Form* furnished, herewith, which shall be completed as a formal document in its entirety.
- b) Exceptions to any of the items on the *Specifications* shall be clearly noted by the *Bidder* as exceptions.
- c) *Owner* may consider as informal any *Bid*, which contains an alteration or a departure from the *Bid Form*, *enclosed Specifications and Drawings* other than specified.
- d) *Bid Documents*, submitted by all *Bidders*, shall be enclosed in outer and inner envelopes, both of which shall be sealed and clearly labeled with the words, "*Bid Documents*".
- e) *Owner* will neither consider nor accept any *Bid*, which is received after the time established for the receiving of same.
- f) *Owner* reserves the right to waive any information in *Bidding* or to reject any and all *Bids*.
- g) The *award* of the contract will be made within five (5) days after opening of the *Bids*.
- h) The *Contract* will be based upon the completion of the work according to the *Specifications*.
- i) The *Owner* reserves the right to award all or part of the requested services to one or more contractors, to reject any or all bids, to negotiate changes in the scope of work or services to be provided, and to otherwise waive all technicalities, as the owner deems to be in their best interest.

2.0 Introduction

The scope of work in this document is for the removal of asbestos containing materials for the Owner at the office building located at 4650 Broadway in New York, New York. The purpose of this document is to define the asbestos abatement scope of work. Any changes to this scope shall be submitted by the bidder in writing with their bid.

Materials identified as asbestos containing within the asbestos survey are outlined in the below table by location of the asbestos containing material with an estimated quantity.

Location	Material	Quantity	Drawing	Abatement Procedure
Roof Level				
Roof	Roof membrane & flashing	65,189 SF	AR-3	Attachment FR & R
Roof	Wall & Duct Tar	1,500 SF	AR-3	Attachment FR & R
Roof	Cooling Tower Fill & Drip Eliminator	292 SF	AR-3	Attachment F & R
Roof	Pipe Insulation	159 LF	AR-3	Attachment T & R
Basement Level				
Under Room	Under Insulation	1,260 SF	AR-4	Full Containment
Parking Area	Pipe Insulation	3,010 LF	AR-4	Attachment T & R
Tenant Floors				
1 st Floor	9"x3" VFT with ACM block mastic under 12"x12" VFT	48,126 SF	AR-1	Attachment VA
1 st Floor	Pipe Insulation	759 LF	AR-1	Attachment VA
1 st Floor	Spray-applied fire proofing	4,264 SF	AR-1	Attachment VA
2 nd Floor	9"x3" VFT with ACM block mastic	48,126 SF	AR-2	Attachment VA
2 nd Floor	Pipe Insulation	759 LF	AR-2	Attachment VA

All quantities are to be field verified via walkthroughs by the bidder; the bidder will not receive any change orders for additional quantities found during the project and will receive penalties for any disruption in work based upon extras and specification changes.

3.0 General Conditions

The Contractor (referred to hereafter as bidder) is solely responsible for supplying all costs and burden associated with permitting, qualified labor, materials, disposal and equipment necessary to perform the work required to successfully complete this project in compliance with this specification.

3.0.1 The bidder is required to submit the following documents with their bid package:

- a) A valid copy of the bidder's State of New York Department of Labor Company Asbestos License;
- b) A Certificate of Insurance with a minimum policy of \$5,000,000.00 general aggregate with \$5,000,000.00 for each occurrence; insurance certificates; the awarded bidder must list specific entities as additional insured and certificate holders;
- c) A copy of the bidder's Health and Safety Plan;

3.0.2 Bidder shall maintain a safe, clean and orderly work site, with the proper postings as per all Federal, State and Local Ordinances and Laws. The Bidder shall erect and maintain isolation barriers, warning signs and all other means for protection / warning to ensure maximum safety.

3.0.3 The Bidder shall not permit any condition to exist or engage in any practice that would result in a hazardous or a potentially hazardous condition for the building occupants, including but not limited to the tenants, Owner's employees, or the bidder's work force.

3.0.4 Bidder shall maintain harmonious labor throughout the project.

3.0.5 If the successful bidder fails to execute the contract within fourteen (14) days of award, the Owner, at his option may consider the bid and the acceptance of it to be null and void due to abandonment of the project by the bidder.

3.0.6 No changes in work are authorized or considered valid unless the Owner has signed a Change Order directing this change.

3.0.7 The Environmental Consultant will be on site at all times when work is in progress to assure compliance with all regulations and these specifications. The Environmental Consultant shall inspect the work at least once per work shift. The Environmental Consultant shall keep the Owner informed of the progress of the work based on his observations and will endeavor to guard the Owner against defects and deficiencies in the work.

3.0.8 Owner's property that is to remain in place shall be protected. If damaged by the Bidder, the Bidder shall, at Owner's discretion, either replace damaged items or reimburse the Owner for replacement at no cost to the Owner.

3.0.9 The Bidder may be back charged at the Owner's discretion for all costs associated with failure to meet the scheduled completion date. This cost shall include, but will not be limited to: Consultant's fees, loss of rental income, management charges, etc.

3.0.10 The Bidder shall take all precautions to protect his workmen, as per USEPA, OSHA, New York State and New York City Regulations.

- 3.0.11 The Bidder shall be responsible for payment of all royalties and licenses required to accomplish his work. The Bidder shall hold the Owner, Owner's agent and the Consultant harmless from any damages, losses, and other expenses arising from all suits or claims for violations, infringement on any patent rights or from negligence of work. The Bidder shall be responsible for notifying the Owner and/or Consultant if he has a reason to believe that a product specified a process or design is an infringement of a patent so that an alternate method / product may be considered if feasible.
- 3.0.12 The Bidder will Hold Harmless and assumes all responsibility with regard to any and all violations pertaining to the asbestos removal project(s).
- 3.0.13 Any delay caused in any part by the asbestos abatement contractor that impacts the starting the project on time, completing phasing end dates during the project and/or completing the project at it's designated end date will result in assessed penalties imposed by the owner against the asbestos abatement contractor.
- 3.0.14 The Bidder's application for final payment shall include the following items:
- a) Copy of Bidder's New York Asbestos License.
 - b) Copy of Bidder's Insurance Certificate.
 - c) Copy of Notifications and Variances.
 - d) Completed Waste Manifests.
 - e) Copy of Workers' New York State and New York City Asbestos Licenses and Medicals.
 - f) Copies of Daily Logs and Daily Sign-In/Out Sheets.
 - g) Copy of OSHA Air Sampling Results
 - h) Copy of Waste Transporter's and Landfill Permits
 - i) Copy of Landfill / Disposal Facility Manifests

The above items shall be submitted to the Consultant for verification and approval.

4.0 Asbestos Removal - General

Bidder shall submit a project approach with their bid submittal, the project approach shall conform to these specifications, if changes are to be made to these specifications the bidder will outline these changes within their bid package for review.

The owner will be conducting air monitoring throughout the project, the bidder will have the on-site air monitor do visual inspections of the completed area(s). In addition all work area(s) shall be maintained and remain intact until the air monitor has notified the bidder to dismantle any work area(s).

- 4.0.1 The owner will provide water and electricity to the site.
- 4.0.2 The bidder will have a Ground Fault Circuit Interrupter (GFCI) panel delivered to the site, a minimum, 2 days prior to the start of the project.
- 4.0.3 The bidder is required to have the following items posted on site throughout the duration of the project: Bidder Health and Safety Plan; EPA NESHAP 40 CFR Part 61 subparts A & M; OSHA Construction Standard 29 CFR 1926.1101; Chapter 469, New York State Department of Labor Industrial Code Rule 56 and New York City Department of Environmental Protection Title 15 Chapter 1 Attachments FR & R, and project notification, licenses and worker certificates.
- 4.0.4 The decontamination facility will be fully constructed and operational at each work area(s) prior to asbestos removal activities taking place. All polyethylene sheeting will be 6-mil opaque, fire-retardant polyethylene sheeting with reinforced polyethylene sheeting for the decontamination floor.
- 4.0.5 All abatement activities are to be followed as indicated by this specification and all Federal, State and Local Laws. The Bidder Holds Harmless and assumes all responsibility with regard to any and all violations.
- 4.0.6 All asbestos debris is to be immediately placed in black 6-mil waste bags that are clearly marked with all appropriate signage under EPA and New York State and New York City regulations. Waste will not be allowed to accumulate inside the work area.
- 4.0.7 Waste bags are to be kept in an already established holding area, inside an on-site roll-off container or to be removed off-site when filled. No more than 40 cubic yards of waste will be stored for a period of more than 72 hours and waste bags are to be removed via wait and load. Note: waste manifests shall be provided for each pick up to the consultant prior to leaving the site.
- 4.0.8 If during abatement air sample results are reported above 0.01 fcc, then clearance air samples will be required to be collected and analyzed. Once clearance air sampling results are reported by the laboratory to CNS, the bidder will be notified and allowed to breakdown.

4.0.9 The substrates will be encapsulated once final clearance results are received from the laboratory.

4.1 Asbestos Removal – Full Containment Procedures

Full containment procedures as outlined in NYSDOL ICR-56 and NYCDEP Title 15 Chapter 1 shall be strictly adhered to by the contractor. Full containment procedures are to be followed for the removal of ACM boiler insulation from the boiler room. Estimated quantities and locations are noted within the table of Section 1.0 of this document and project drawings.

4.1.0 The work area will be cordoned off with associated warning signs, the GFI Panel will be connected to the building power and all electric will be locked out and tagged out prior to decontamination construction.

A worker and waste decontamination facility will be constructed and operational at each work area prior to asbestos removal activities and made operational prior to any work area preparation activities.

4.1.1 Background, Pre-abatement, During Abatement and Clearance Air samples will be collected during all phases unless indicated by Site Specific Variance.

4.1.2 Bidder shall not breakdown work area(s) until a final visual and clearance air sample results are below 0.01 fibers per cubic centimeter (f/cc).

4.1.3 In the event air sample analysis exceed 0.01 f/cc during the project all work shall cease and proper repairs and/or cleaning shall be completed by the bidder; repairs include but are not limited to wet wiping area(s) designated by CNS Management, equipment replacement and/or HEPA filter replacement. Multiple air sample failures shall not be cause for bidder to receive extra(s), project penalties from Owner will be issued if schedule is exceeded.

4.1.4 Negative Exhaust Units will be placed inside the work area; exhaust ducts will be run to a manifold and exhausted outside the building. Negative pressure shall be established and maintained at -0.02" water column through the project.

4.1.5 The work area shall be pre-cleaned, utilizing wet methods and HEPA-vacuuming.

4.1.6 The work area will be plasticized with opaque, 6-mil fire retardant polyethylene sheeting.

4.1.7 The environmental consultant shall inspect the work area once preparation activities have been completed and prior to removal activities.

4.1.8 All asbestos materials will be maintained wet during removal, and once removed from the substrate, placed directly in labeled 6-mil polyethylene waste bags.

- 4.1.9 Asbestos waste will not be allowed to accumulate in quantities greater than 40 cubic yards on site. Waste containers will be hard walled and hard topped and be lined with 2-layers of fire retardant 6-mil polyethylene sheeting.
- 4.1.10 All generated asbestos waste shall be disposed of as asbestos containing. Note: waste manifests shall be provided for each pick up to the consultant prior to leaving the site.

4.2 Asbestos Removal – Site Specific Variances

Use of New York City Department of Environmental Protection Attachments (FR, R, TM and VA) for a Site Specific Variance will be utilized for the project. All procedure outlined in the Site Specific Variance will be adhered to by the contractor. Any fines incurred by the owner due to the asbestos abatement contractor actions will be the responsibility of the asbestos abatement contractor.

The Site Specific Variance will be prepared by CNS Management Corp and will be the responsibility of the contractor to file the ACP-9.

4.2.1 Asbestos Removal – Attachments FR & R - ACM Roofing Materials

The abatement contractor is requesting a variance to perform the removal of the roofing ACM's by foam procedures utilizing remote worker and waste decontamination facilities. The asbestos abatement project for the roof will be completed in one phases, with the worker and waste decontamination facilities being constructed on roof.

The abatement contractor requests relief from the following subsections for the removal of the roofing materials:

- | | |
|---------------------|--|
| 1-41(c) | During abatement air sampling inside the work area |
| 1-41(d) | No post abatement clearance air monitoring |
| 1-81(j) | Not to pre-clean the work area |
| 1-81(m) | Partial plasticization of the work area |
| 1-82(a) & 1-83(a) | Remote worker and waste decontamination facilities |
| 1-91 | Engineering controls |
| 1-102(b) | Not to saturate ACM material with water |
| 1-112(f) & 1-112(e) | No settling periods or 2 nd & 3 rd cleanings |

Prior to commencing removal activities, The abatement contractor will remote construct the worker and waste decontamination facilities on the sixth floor of the building as described in Attachment R. Please see the attached drawing for the exact location of the decon facilities. The roofing materials will be coated with a minimum 1" of foam.

The foam will remain on the material for the duration of the removal activities. Roofing materials will be removed by manual methods or HEPA Equipment power tools and will be immediately bagged in compliance with Attachment FR. Upon completion of the removal, the work area will be thoroughly cleaned. The removal will be performed in accordance with

attachments FR & R. Background, pre-abatement and during air samples will be collected and analyzed by PCM methods for the project.

4.2.2 Asbestos Removal – Attachment FV - ACM Flooring Materials

The abatement contractor is requesting a variance to perform the removal of the flooring ACM's by foam procedures as outlined in Attachment FV. The asbestos abatement project for the flooring materials will be completed on the first and second floors.

The abatement contractor requests relief from the following subsections for the removal of the floor tiles and associated mastic:

- 1-41(d) No post abatement clearance air monitoring
- 1-81(j) Not to pre-clean the work area
- 1-81(m) Partial plasticization of the work area
- 1-91(c) & (g) Engineering Controls
- 1-102(b) Not to saturate ACM material with water
- 1-112(d) & 1-112(e) No setting periods or 2nd & 3rd cleanings

Prior to commencing removal activities, the abatement contractor will construct the worker and waste decontamination facilities on the ground floor of the building. Please see the attached drawing for the exact location of the decon facilities. The work area will be partially plasticized, up 5 feet on the walls. Negative exhaust units will be placed inside the work area to establish negative pressure inside the containment area. The exhaust ducts will be exhausted to the outside of the building and monitored. The flooring materials will be coated with a minimum 1"-3" of foam. The foam will remain on the material for the duration of the removal activities. Flooring materials will be removed by manual methods and will be immediately bagged in compliance with Attachment FV. Upon completion of the removal, the work area will be thoroughly cleaned. The removal will be performed in accordance with attachment FV. Background, Pre-abatement and during abatement air samples will be collected and analyzed by PCM methods for the project.

4.2.3 Asbestos Removal – Attachment VA - ACM Flooring Materials & Pipe Insulation within the Same Work Area

The abatement contractor is requesting a variance to perform the removal of the flooring ACM's by foam procedures with pipe insulation within the same work area as outlined in Attachment VA. The asbestos abatement project for the flooring materials will be completed on the first and second floors.

The abatement contractor requests relief from the following subsections for the removal of the floor tiles and associated mastic:

- 1-81(m) Partial plasticization of the work area

Isolation barriers shall be installed with 2 layers of 6-mil plastic sheeting sealed with tape and or caulked for air tightness. The number of air changes required for during abatement shall be increased to 6. The walls of the work area shall be plasticized with two layers of 6-mil plastic sheeting. The asbestos pipe insulation shall be removed first by employing wet methods. A visual inspection shall be conducted by the asbestos supervisor and project monitor in order to ensure the absence of debris on the floor. VAT removal shall not begin until at least one hour after the visual inspection in order to decrease the fiber concentration inside the work area. The floor tiles will be removed by utilizing foam methods as detailed in Attachment IV. Once the removal of the floor tiles is completed a three phase cleaning as detailed in section 1-112, employing a 12 hour, a 4 hour and a minimum 1 hour waiting/settling periods will be adhered to and then followed by clearance air monitoring.

4.1.4 Asbestos Removal – Attachment E - ACM Cooling Tower Fill Material

The abatement contractor is requesting a variance to perform the removal of asbestos containing fill material from the roof top cooling tower as outlined in Attachment F.

The abatement contractor requests reliefs from the following subsections for the removal of the cooling tower fill material:

- | | |
|---------|---|
| 1-81(m) | Partial plasticization of the work area |
| 1-91(c) | Engineering Controls |

A Remote worker and waste decontamination facility will be established on the roof level adjacent to the cooling tower. Isolation barriers shall be installed with 2 layers of 6-mil plastic sheeting sealed with tape and or caulked for air tightness. The floor of the work area shall be plasticized with two layers of 6-mil polyethylene sheeting. The exterior of the cooling tower (except for the entrance) shall be plasticized with two layers of 6-mil polyethylene sheeting and an additional layer of 6-mil reinforced polyethylene sheeting. Negative pressure equipment shall be installed and operated during the entire project until clearance air sampling is completed. The work area shall be smoke tested daily to ensure there are no stagnant points in the work area. Once the removal of the cooling tower fill material is completed a three phase cleaning as detailed in section 1-112, employing a 12 hour, a 4 hour and a minimum 1 hour waiting/settling periods will be adhered to then followed by clearance air monitoring.

4.1.5 Asbestos Removal – Attachment T – Glovebag Procedures Inside Tent Enclosure

The abatement contractor is requesting a variance to perform the removal of pipe insulation as outlined in Attachment T. The asbestos abatement project for the pipe insulation materials will be completed on the basement and roof level.

The abatement contractor requests relief from the following subsections for the removal of the pipe insulation:

- | | |
|---------|---|
| 1-81(m) | Partial plasticization of the work area |
|---------|---|

Isolation barriers shall be installed with 2 layers of 6-mil plastic sheeting sealed with tape and or caulked for air tightness. The number of air changes required for during abatement shall be increased to 6. The walls of the work area shall be plasticized with two layers of 6-mil plastic sheeting. The asbestos pipe insulation shall be removed first by employing wet methods. A visual inspection shall be conducted by the asbestos supervisor and project monitor in order to ensure the absence of debris on the floor. VAT removal shall not begin until at least one hour after the visual inspection in order to decrease the fiber concentration inside the work area. The floor tiles will be removed by utilizing foam methods as detailed in Attachment IV. Once the removal of the floor tiles is completed a three phase cleaning as detailed in section 1-112, employing a 12 hour, a 4 hour and a minimum 1 hour waiting/settling periods will be adhered to and then followed by clearance air monitoring.

1.0 Compliance Report

CNS Management Corp (CNS) monitored the asbestos removal procedures of Delta Environmental within the building located at 4650 Broadway in Manhattan, New York aka Sherman Plaza. The asbestos removal project was completed in two phases; Phase 1 started on April 28, 2008 and lasted through June 13, 2008 and Phase 2 started on March 3, 2009 and lasted through April 2, 2009. Phase 1 of the asbestos project consisted of the removal of 1,266 Square Feet (SF) of boiler insulation, 1,500 Linear Feet (LF) of pipe insulation, 88,252 SF of VAT floor tiles and 4,264 SF of spray applied fire proofing throughout the entire first floor, second floor and basement boiler room. Phase 2 of the asbestos project consisted of the removal of 5,010 LF of pipe insulation within the basement parking garage and 152 SF of cooling tower fill on the roof.

The removal project was completed in compliance with New York City Department of Environmental Protection (NYCDEP) Title 15 Chapter 1 asbestos regulations with the use of Sub-Chapter G for interior materials prior to demolition and Attachments F & K for the non-fibrous cooling tower fill.

A total of 534 cubic yards of asbestos-containing waste was generated from the removal project. The waste was containerized in doubled 6-mil poly bags and each bag was labeled with the generator name and location as outlined in the EPA's regulation 40 CFR Part 61. The waste transporter was ATC located at PO Box 1044 in Hampton Bays, NY, who transported the waste to Minerva Landfill located at 900 Minerva Road in Weymansburg, Ohio. Please see Delta's close out package for the completed waste manifest.

CNS representatives Mr. Felix Ogleton (Certificate #05-00002) and Mr. Pagan Diego (Certificate #04-05117) were the on-site Project Monitors for the project. A daily log was maintained indicating visitors and visual inspection findings throughout the project. The work area was monitored via air sampling throughout the project in compliance with the NYSDOL regulations. A field sketch identifying the locations of the daily air-samples was completed on the pre-abatement checklist form and updated when the locations of the air-samples changed.

Air samples were collected using 0.8 micron Mixed Cellulose Ester (MCE) filters mounted on a rig and attached to a high volume sampling pump. These pumps are calibrated at the beginning of each work shift and each hour during the work shift. Each sample ran for at least 90 minutes to obtain the minimum volume of air as outlined in the National Institute for Occupational Safety and Health's (NIOSH) sampling method 7400 (NIOSH 7400).

The collected air samples were untreated daily to Analytical Laboratories (ILAP # 11480) located at 117 East 30th Street in New York City, New York. The samples were analyzed via Phase Contrast Microscopy (PCM) in compliance with NIOSH 7400 protocol for analysis. PCM is used to count non-specific fibers of certain length to width (L:1) ratios and the results are reported as fibers per cubic centimeter (Fcc).

CNS has completed final visual inspections with clearance air monitoring for Phase 1 on May 8, 21, 30, June 9, 16 of 2008 and for Phase 2 on March 17, 23 and April 2 of 2009. The final inspections were conducted by the Project Monitor and were completed after third phase (or final) cleaning. The findings of the inspection(s) were recorded in the contractor supervisor log book. Laboratory analytical results indicate all airborne asbestos fiber levels were below the NYCDEP, NYSDOL, and NESHAP re-occupancy regulation level of less than 0.01 Fcc.

If you have any questions or require additional information, call me at (516) 952-5225.

Sincerely,

Michael R. Nolan
Project Manager

RE: ERIC Management Corporation
200 West 121 Street
P.O. 8411046
2001146; Bowenman Fossil; ERIC Education; and Fossil (Machinery)

Dear Charles Bowenman:

Enclosed are the results for PLAT searching with respect to the following ERIC Management Corporation submission received at AmeriSci on Monday, April 25, 2000, for a 20 page document:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13

This PL searching was conducted by AmeriSci's staff of trained and certified PL searchers. These searches were performed according to PLAT methodology as indicated in ERIC Manual (PLAT) Form #1, 03/1994. The searching rules used are identified in previous versions of this protocol as "PL rules which operate on word stems only". The ERIC database contains a sampling of 200,000 word stems.

The report defines PLAT as the unique analysis which is used to identify word stems. AmeriSci assumes no responsibility for content supplied data such as "multiple location" or "relevance expansion". This report must not be used to make personal recommendations by committee or any other committee agency. Complete search results are available and available upon written request. The National Institute of Standards and Technology Association membership includes this PLAT report which is not available, except in full access the report of the laboratory.

AmeriSci appreciates the opportunity to serve your organization. Please contact us for any further information or with any questions.

Sincerely,

Dawn E. Sullivan
PLAT Manager

RE: Ch2 Management Corporation
230 West 230th Street
P.O. Box 1000
New York, New York 10011
[Original Document Filed Pursuant to Order of the Court dated 5/7/1999]

Dear Charles Powers:

Enclosed are the results of PCR analysis of the following Ch2 Management Corporation papers received at AmeriSci on Tuesday, April 20, 1999, in a 14-page document:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15

The 15 samples submitted to AMERISCI were received in accordance with the Chain of Custody. These samples were prepared according to PCR methodology as specified in AMERISCI Method #100, Item #1, to 10004. The document you have sent was checked for matches versus the method as it may occur in a future report. The results of this analysis are a summary of the five most errors.

This report refers ONLY to the sample analysis performed in laboratory use of this code. AmeriSci assumes no responsibility for negative results due to any "source control" or "no volume" samples. This report may not be used to create forensic conclusions by identification of any individual (entity, subject). Conclusions regarding identification is and will not be made upon review. The National Institute of Standards and Technology (NIST) is responsible for the results. Therefore, this report must not be misinterpreted, presented, or used without the approval of the laboratory.

AmeriSci is pleased to have the opportunity to assist your organization. Please contact us for any further assistance or additional questions.

Sincerely,

Mark E. Poulos

PCR Analyst

Re: Chief Management Corporation
Lab Number 200804151
P.O. #12781108
FOI DATES: December 1999, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008

Dear Charles Francis:

Enclosed are the results for FOIA requests received by the Laboratory (Chief Management Corporation) regarding records re: AMERISCI in December, April 20, 2008, for a 30 day response.

25, 26, 27, 28, 29, 30, 31, 01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31

The 27 samples analyzed by the Laboratory were analyzed to determine the types of substances. These samples were prepared according to the Laboratory's standard operating procedures (SOP) for the analysis of samples. The remaining nine were analyzed in accordance with the Laboratory's SOP for the analysis of samples. The Laboratory's SOP for the analysis of samples is available on the Laboratory's website.

This report contains ONLY the information requested in the FOIA request. AMERISCI disclaims any responsibility for the accuracy or completeness of the information provided in this report. This report may not be used for any other purpose without the prior written consent of the Laboratory. The Laboratory disclaims any responsibility for the accuracy or completeness of the information provided in this report. The Laboratory disclaims any responsibility for the accuracy or completeness of the information provided in this report.

AMERISCI disclaims any responsibility for the accuracy or completeness of the information provided in this report.

Sincerely,

Charles Francis

Dear Charles Powers:

Enclosed are the results for PCM asbestos analysis of the following CNS Management Corporation samples received at AmeriSci on Thursday, May 01, 2008, for a 24 hour turnaround.

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15, 16

The 16 samples contained in Air Cassettes were shipped to AmeriSci via Hand Delivered. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Issue #2, 9/15/94. The counting rules used are described in previous versions of this method as "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cc of filter area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is archived and available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

Martin E. Brothers

A261048; Stewart Plaza; 455E Broadway - 2nd Floor (Dobbs)

Dear Charles Powers,

Enclosed are the results for PCM asbestos analysis of the following CNS Management Corporation samples received at AmeriSci on Thursday, May 01, 2008, for a 24 hour background:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15, 16

The 16 samples contained in Air Cassettes were shipped to AmeriSci via Fedex Delivered. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Issue #2, 8/15/04. The counting rules used are described in previous versions of this method as "X" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/ccm of filter area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is archived and available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

Marvin E. Brothens

Re: Cell Management Corporation
Attn: Norman Berman
P.O. Box 1062
220 West 125th Street, 10th Floor, New York, NY 10019

Dear Charles Pincus:

Enclosed are the results for PCR and genetic analysis of the following Cell Management Corporation samples which include 26 samples in quantity, May 02, 2003, from 24 hair samples.

11, 12, 13, 14, 15, 16, 17, 18, 19, 20

The 26 samples analyzed in the laboratory were shipped to Forensic and Family Genetics. These samples were analyzed according to PCR methodology as reported in NCSM Volume 1, Part 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26. The samples were analyzed for presence of the following: 1) 12 samples of hair samples from the head. The total amount requested is 12 samples of the hair from the head.

The report refers ONLY to the samples analyzed requested as shown on the list above. Additional requests for sample analysis for samples requested may occur as "unforeseen known" as the report is filed. This report shall not be used to claim presence of presence by AmeriSci in any forensic laboratory agency. Complete individual information is provided and available upon written request. The Material Transfer Agreement and Laboratory Accreditation Requirements shall be that the report shall not be reproduced, copied or distributed the report of the laboratory.

Should you require any information to serve your organization please contact us for any further questions or with any questions.

Sincerely,

Norman Berman

Copy Release Request:

Enclosed are the results for PCM approval analysis of the following USC Management Corporation contracts located at 111 East 42nd Street, New York, NY 10017, for a 24 hour period:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15, 16.

The 16 contracts mentioned in Document were assigned to AmeriSci via Project Delivery. These contracts were prepared according to World Architecture or modified or modified World Architecture. The contracts were used for the purpose of the project of the subject of this report. The data obtained represents a summary of the data from these contracts.

This report contains only the data requested as shown on the 111 East 42nd Street. AmeriSci assumes no responsibility for the accuracy of the data as shown on the 111 East 42nd Street. This report may not be used for any other purpose without the express approval of AmeriSci. AmeriSci assumes no responsibility for the accuracy of the data as shown on the 111 East 42nd Street. This report may not be used for any other purpose without the express approval of AmeriSci.

AmeriSci represents the contractor to serve your organization. Please contact us for any further information or with any questions.

Sincerely,

Charles Stewart
PCM Manager

RE: QAS Management Corporation
100 Avenue of the Americas
N.Y. 10013
100 Avenue of the Americas, 21st Floor (QAS)

Dear Charles Farnas:

Enclosed are the results for PCAD analysis of the following QAS Management Corporation samples received at AmeriSci on Friday, May 04, 2000, for a full description:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15, 16

This is a summary statement as for detection only as reported in AmeriSci on their laboratory. These samples were analyzed according to PCAD methodology as specified in the FBI manual, dated 07, 1999. The covering sheet used in the report is present version of data reported in "A" files which is being placed within the report. This table attached represents a summary of the data used in the report.

This report contains ONLY the analysis of report submitted in identifying only to this report. AmeriSci reserves the responsibility for opinions expressed there such as "average opinion" or "no opinion expressed". This report must not be used to claim product identification by AmeriSci or any other laboratory agency. Complete analytical interpretation is available from AmeriSci upon written request. The original version of this report was in laboratory handwritten interpretation. However, this file report must be interpreted, except in the absence the receipt of the laboratory.

AmeriSci appreciates the opportunity to serve your organization. Please contact us for any further assistance or with any questions.

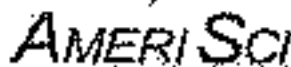

Sincerely,

Charles Farnas
PCAD Manager

RE: **CNS Management Corporation**
Job Number 208032092
P.O. #A281048
A281048; Sherman Plaza, 4880 Broadway - 2nd Floor - Dying

Dear Charles Powers:

Enclosed are the results for PCM asbestos analysis of the following CNS Management Corporation samples received at AmeriSci on Friday, May 09, 2008, for a 24 hour turnaround:

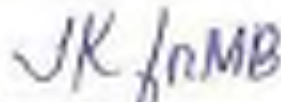

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15, 16.

The 16 samples contained in Air Cassettes were shipped to AmeriSci via Next Day Delivery. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Issue 42, 8/15/94. The counting rules used are described in previous versions of this method as "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cc min of filter area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume captured". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is provided and available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

A handwritten signature in blue ink that reads "JK for MB".

Address: Sherman Plaza, 4650 Broadway 2nd Floor Plaza #1 - Clearance (Report Amended
5/14/2008)

Dear Charles Powers:

Enclosed are the results for PCM asbestos analysis of the following CNS Management Corporation samples received at AmeriSci on Friday, May 09, 2008, for a 12 hour turnaround:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13.

The 13 samples contained in Air Castles were shipped to AmeriSci via Hand Carried. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Issue #2, 8/15/94. The counting rules used are described in previous versions of this method as "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cc m3 of fiber area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analysis documentation is archived and available upon written request. The National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced, except in full without the approval of the laboratory.

RE: CNS Management Corporation
Job Number 200602084
P.O. #A251048
A251048; Shomson Plaza; 4650 Broadway - 2nd Floor Plaza #1 (Clearance)

Dear Charles Powers:

Enclosed are the results for TEM fiber analysis of the following CNS Management Corporation samples received at AmeriSci on Friday, May 05, 2006, for a 12 hour turnaround:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13

The 13 air samples were sent to AmeriSci via hand delivered. These samples were prepared according to AHERA Protocol.

Table 1 represents a summary of pertinent information used for the structure (fiber) density and concentration calculations. Included are the size of each structure counted, the structure density and concentration, type of foreign material detected and the analytical sensitivity, which represents the concentration by the detection of one structure in the TEM structure count. Copies of the Fiber Count Sheets are included. These data sheets contain information for structure length/diameter, structure type, structure morphology and pertinent information on EDS, SAED and photography.

This report relates ONLY to the sample analysis expressed as structure density. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci, NVLAP or any agency of the U. S. Government. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the written approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

Paul J. Mucha
Laboratory Director

Dear Charles Powers:

Enclosed are the results for PCM asbestos analysis of the following CNS Management Corporation samples received at AmeriSci on Tuesday, May 13, 2008, for a 24 hour turnaround:

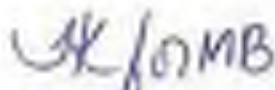

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15, 16, 17, 18.

The 18 samples contained in Air Cassettes were shipped to AmeriSci via ground shipment. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Issue #7, 07/15/04. The counting rules used are those used in previous versions of this method as "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/sq ft of filter area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air pump sample". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is attached and available upon written request. The National Institute of Standards and Technology Accreditation requirements stipulates that this report must not be reproduced, except in full without the approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Dear Charles Powers:

Enclosed are the results for PCM distortion analysis of the following CNS Management Corporation samples received at AmeriSci on Wednesday, May 14, 2008, for a 24 hour turnaround:

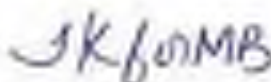

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20

The 20 samples contained in Air Cassettes were shipped to AmeriSci via J&J and Delivered. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Issue #7, 01/15/04. The counting rules used are described in previous versions of this method as "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cc, mm of filter area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci verifying agency. Complete analytical documentation is available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

Dear Charles Powers:

Enclosed are the results for PCM asbestos analysis of the following CNS Management Corporation samples received at AmeriSci on Wednesday, May 21, 2008, for a 12 hour turnaround:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14

The 14 samples contained in Air Cassettes were shipped to AmeriSci via Hand Delivered. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Issue 02, 8/15/04. The counting rules used are described in previous versions of the method as "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cm³ of filter area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used in claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is archived and available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

Marvin E. Brothers
Operations Supervisor

Dear Charles Powers:

Enclosed are the results for TEM fiber analysis of the following CNS Management Corporation samples received at AmeriSci on Wednesday, May 21, 2008, for a 12 hour turnaround:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14

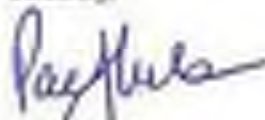

The 14 air samples were sent to AmeriSci via Hand Delivery. These samples were prepared according to NIEBA Protocol

Table I represents a summary of all pertinent information used for the structure (fiber) density and concentration calculations. Included are the size of each structure counted, the structure density and concentration, type of fibrous material detected and the analytical sensitivity, which represents the concentration by the detection of one structure in the TEM structure count. Copies of the Fiber Count Sheets are included. These data sheets contain information for structure length/dia, structure type, structure morphology and pertinent information on EDS, SAED and photography.

This report relates ONLY to the sample analysis expressed as structure density. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume samples". This report must not be used to claim product endorsement by AmeriSci, NYSLAP or any agency of the U. S. Government. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the written approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

A handwritten signature in blue ink, appearing to read "Paul Meehan".

Dear Charles Powers:

Enclosed are the results for PCM asbestos analysis of the following CNS Management Corporation samples received at AmeriSci on Thursday, May 22, 2008, for an immediate turnaround.

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12

The 12 samples contained in Air Cassettes were shipped to AmeriSci via FedEx Overnight. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Issue #2, 09/1994. The counting rules used are described in previous versions of this method as "X" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cc rim of filter area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is archived and available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

Dear Charles Powers:

Enclosed are the results for PCM asbestos analysis of the following CNS Management Corporation samples rec. AmeriSci on Saturday, May 24, 2008, for a 24 hour turnaround:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12

The 12 samples contained in Air Cassettes were shipped to AmeriSci via Hand Delivered. These samples were according to PCM methodology as specified in NIOSH Method 7400, Issue #2, 6/15/04. This sampling uses user in previous versions of this method as "A" rules unless otherwise noted within the report. The table attached is a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cc mm of fiber area. AmeriSci assumes no for customer supplied data such as "sample location" or "air volume sampler". This report must not be used to endorse or by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is archived upon written request. The National Institute of Standards and Technology Accreditation requirements, mandate report must not be reproduced, except in full without the approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or questions.

Sincerely,

Mary E. Brothers
Operations Supervisor

Dear Charles Powers:

Enclosed are the results for PCM collected analysis of the following CNS Management Corporation samples received at AmeriSci on Friday, June 05, 2008, for a 24 hour turnaround:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15

The 15 samples contained in Air Cassettes were shipped to AmeriSci via Hand Delivered. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Issue #2, 8/15/94. The counting rules used are described in previous versions of this method as "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cc m³ of filter area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is received and available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

Marvin E. Broders
Operations Supervisor

Dear Charles Powers:

Enclosed are the results for PCM asbestos analysis of the following CNS Management Corporation samples received at AmeriSci on Monday, June 09, 2008, for a 24 hour turnaround:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15, 16

The 16 samples contained in Air Cassettes were shipped to AmeriSci via Hand Delivered. These samples were processed according to PCM methodology as detailed in NIOSH Method 7400, Issue #2, 8/12/94. The counting rules used are described in previous versions of this method as "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cc (m³) of fiber area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is archived and available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

Reporting Notes:

(1) Fibers are counted by microscopy for blanking with no air volume.

By: [Signature] (AmSci Job #: 206092070) Date: 05/03/06
 Unit of Detection: 1.1 fibers (minimum of 1 fiber) per 100 lpm of air. Results are reported as fibers per minute (FPM) or fibers per cubic foot (FFC) or fibers per cubic meter (FFM).
 Method: Phase Contrast Microscopy (PCM) with a flow rate of 5.5 lpm. The flow rate is constant throughout the test.
 Filter: 0.3 micron HEPA filter. The filter is replaced after every 100 lpm of air.
 Location: 1A West of West Area, 1A East of West Area, 1B South of Lobby, HEPA Maintenance Exhaust #1, HEPA Maintenance Exhaust #2, Field Blank.

Dear Charles Powers:

Enclosed are the results for TEM fiber analysis of the following CNS Management Corporation samples received at AmeriSci on Monday, June 09, 2008, for a 12 hour turnaround:

01, 02, 03, 04, 15, 16, 07, 08, 09, 10, 11, 12.

The 12 air samples were sent to AmeriSci via Honda Delivered. These samples were prepared according to AHERA Protocol.

Table I represents a summary of all pertinent information used for the structure (fiber) density and concentration calculations. Included are the size of each structure counted, the structure density and concentration, type of filter, material detected and the analytical sensitivity, which represents the concentration by one detection of one structure in the TEM structure count. Copies of the Fiber Count Sheets are included. These data sheets contain information for structure length/diameter, structure type, structure morphology and pertinent information on EDS, SAED and photography.

This report relates ONLY to the sample analysis expressed as structure density. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci, NYSLAP or any agency of the U. S. Government. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the written approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

Paul J. Mucha
Laboratory Director

New York, NY 10018; Executive Office, 240 West 41st Street (Hydrogen)

Dear Granting Offices:

Enclosed are the results for 2008 research activities of the following CNS Management Corporation subsidiary divisions as
Amersci Co. Division, June 12, 2008, for a 24 hour period:

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12.

The 24 reports generated by the Corporation were prepared by Amersci Co. Granting Offices. These reports were prepared
according to CNS Management Corporation's procedures as detailed in the CNS Management Corporation's procedures as
presented in the report of the results of the 24 hour period. The 24 reports were prepared by the
offices of the Granting Offices.

The 24 reports were prepared by the Corporation's Granting Offices as detailed in the report of the results of the 24 hour period. Amersci Co. Granting Offices are responsible
for the results of the 24 hour period as "granting offices" in the CNS Management Corporation. The reports were prepared by the
offices of the Granting Offices as detailed in the report of the results of the 24 hour period. The 24 reports were prepared by the
offices of the Granting Offices as detailed in the report of the results of the 24 hour period. The 24 reports were prepared by the
offices of the Granting Offices as detailed in the report of the results of the 24 hour period.

Amersci Co. Granting Offices are responsible for the results of the 24 hour period. Amersci Co. Granting Offices are responsible

Phase Contrast Microscopy (PCM) Filter Results

6250 SW 14th Street, Evergreen Park, IL 60120

Account #	Client Name	Filter Type	Location	Lot #	Filter Theory	Filter Date
5000000000	CMAA Mechanical Contractors	HEPA	6250 SW 14th Street	02	0.3	10/10/2000

Reference: Filter Test

Requesting Agency:

(1) Samples were collected for analysis for bacteria and fungi. The results of the analysis are as follows:

1. Bacteria: 1000 CFU/gm. This is a high count for a HEPA filter. The cause of this contamination is unknown.

2. Fungi: 1000 CFU/gm. This is a high count for a HEPA filter. The cause of this contamination is unknown.

Microscopic images of the filter media showing the presence of bacteria and fungi are attached to this report.

The graph shows a single peak in the data, indicating a high concentration of bacteria and fungi at a specific time. This is consistent with the high counts reported in the text above.

10/10/2000

New York, NY 10018

RE: ONE Manufacturing Corporation
Job Number 2006/02505
P.O. #A241982
#251016: 440 Broadway, Stamford Conn - Baker House & Dept

Dear Compliance Director:

Enclosed are the results for PCMA random analysis of the following ONE Manufacturing Corporation samples received at AmeriSci on Friday, Jan 13, 2006. Re a 24-hour turnaround.

01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14

The 24 samples submitted to NY ControlLab were shipped to AmeriSci via FedEx Overnight. These 24 samples were packaged according to PCMA methodology as specified in Federal Method 7000, issue 03, 04/05/06. The containers were used and identified in previous analysis of this material as "A" bags which otherwise would appear on the report. The latter identified containers a subsidiary of the four main results.

The report reflects that 15 of the samples analyzed exceeded the minimum value of 0.05 mg/g. Analytical precision was approximately 10% and the reported data were as "average values" or "see volume attached". This report must not be used by anyone for any determination of compliance or any AmeriSci ControlLab activity. Complete analytical documentation is attached and available upon written request. The forensic methods of Sampling and Testing are described in the attached report and the report must not be used for any compliance activity or to address the material of the laboratory.

AmeriSci operates this laboratory as a public good. Please contact us for any further information or any other questions.

Sincerely,

Thomas E. Brennan
Operations Director

Dear Charles Powers:

Enclosed are the reports for PCM asbestos analysis of the following CNS Management Corporation samples received at AmeriSci on Monday, June 16, 2008, for a 24 hour turnaround.

01, 02, 03, 04, 05, 06, 07, 08

The 8 samples contained in A0 Cassettes were shipped to AmeriSci via Hand Delivered. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Issue #2, 8/16/94. The counting rules used are described in previous versions of this method or "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cc mm of filter area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is archived and available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

310-2099)

Dear Charles Powers:

Enclosed are the results for PCM asbestos analysis of the following CMS Management Corporation samples received at AmeriSci on Saturday, March 14, 2008, for a 24 hour turnaround:

1, 2, 3, 4, 5, 6, 7, 8

The 8 samples submitted in Air Cassettes were shipped to AmeriSci via Floral Delivery. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Sept 82, 8-1589. The counting rules used are described in previous versions of this method as "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cc num of filter area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is archived and available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

Marvin E. Brothman

Dear Charles Powers:

Enclosed are the results for PCM asbestos analysis of the following CNS Management Corporation samples received at AmeriSci on Tuesday, March 17, 2008, for a 24 hour turnaround:

23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36

The 14 samples contained in Air Cassettes were shipped to AmeriSci via Hand Delivered. These samples were prepared according to PCM methodology as specified in NIOSH Method 7402, Issue #2, 8/19/98. Ten counting rules used are described in previous versions of this method as "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cc m3 of fiber dust. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is provided and available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

Marvin E. Brothers
Operations Supervisor

Dear Charles Powers:

Enclosed for you are the first two issues of the Laboratory's *Environmental Compliance* journal, published on Wednesday, March 15, 2000, for a total of two issues.

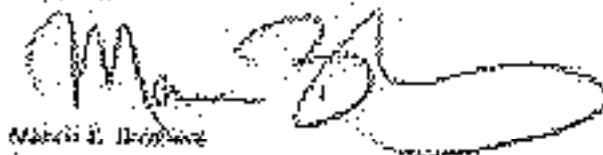

1, 2, 4, 6

The 2 articles contained in the 2 issues were shipped to America's Water Network. Your articles were prepared according to EPCO methodology as explained in Federal Register 1999, issue 42, 26187. The Laboratory will have an editorial in process entitled "The Laboratory's EPCO Model" which will be published within the journal. The table attached represents a summary of the EPCO model.

The Laboratory's EPCO is the single most important document in the EPCO model. America's Water Network is responsible for ensuring that the EPCO is properly applied to the system. The model must be used to ensure that the EPCO is properly applied to the system. The Laboratory's EPCO is the single most important document in the EPCO model. The Laboratory's EPCO is the single most important document in the EPCO model. The Laboratory's EPCO is the single most important document in the EPCO model.

150-11 63rd Street, Flushing, NY 11355
George W. H. Bush Library, P.O.

Dear Charles Powell:

Enclosed are the reports for the articles which are the property of Cable Management Corporation received at AmeriSci on Friday, March 10, 2000. See a list below.

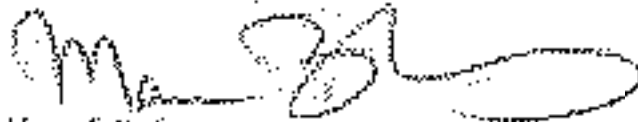

20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30.

The 12 articles contained in the enclosure were shipped to AmeriSci by David Davidson. These articles were prepared according to FBI procedures as reported in FBIHQ MEMO DATED 03/09/00. The reports were used in the search of various versions of the articles as "A" articles which returned copies with the report. The same articles represent a majority of the other search results.

The report refers only to the original articles reported as discussed above. AmeriSci assumes no responsibility for articles reported with such as "copies received" or "as shown copies". The report may not be used to claim product ownership by anyone in any forensic analyzing agency. Forensic analysis/identification is required and available upon written request. The National Institute of Standards and Technology Accredited Laboratory, maintains that the report may not be submitted, except as discussed in the report of the laboratory.

AmeriSci provides this assistance to serve your requirements. Please contact us for any further assistance or with any questions.

Sincerely,

Warren G. Bruchman
Operations Supervisor

RE: GM Management Corporation
660 W. 261 Street Road
P.O. #A261028
Elizabeth, NJ 07201, Attention: George Ford, Industrial Group

Dear Charles Pearce:

Enclosed are the reports for FOM activities completed in the January 1991 Management Conference covering activities in America's Markets, March 23, 1992, for a 12 week period.

RE: 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45

The 14 company categories in the Conference were assigned to America's Market Division. Three categories were provided separately to FOM management as reported in the 1991 Annual Report, pages 42, 43, 44. The company lists were developed in previous editions of the conference. It was noted that certain items were not reported. The same analytical approach is necessary in the following years.

The report covers ONLY the activities reported to America's Market Division. America's Market is responsible for the activities reported from each of the "America's Markets" in the various regions. The report does not include any activities reported by America's Market or any American marketing agency. Company activities reported in various other publications are not included. The financial results of America's Market and Technology Activities (regional, national) are reported in the report and are summarized, placed in the context of the report of the conference.

AmeriSci Corporation has the opportunity to serve your organization. Please contact us for any further information or with any questions.

Sincerely,

Marie E. Siefert
Executive Director

File Date: 03/27/2000, Sherman Ave., 10th Floor

Dear Charles Murray:

Enclosed are the results of the audit report of the following CSIS Management Corporation accounts conducted at
New York and Albany, March 23, 1998, Re: a 24 hour investigation.

1, 2, 3, 4, 5

The financial records in the accounts were reviewed by AmeriSci via Field Offices. These records were prepared
according to GAAP methodology and reported to the NY Office (NYO), 117 East 27th Street. The accounts were found to be
in compliance with the rules of the NY Office. The NY Office will continue to monitor the accounts and
report to the NY Office as required.

The report value (NYO) to the account owner is enclosed in this report. AmeriSci assumes no responsibility
for incorrect reported data such as "transfer account" or "no account reported". The report may not be used to claim or defend
responsibility for activities of any AmeriSci employee or agent. Complete and proper recordkeeping is required for accurate
reporting of all transactions. The financial records of the accounts and the NY Office will continue to monitor the
accounts and report to the NY Office as required.

AmeriSci represents the opportunity to review your company. Please contact us for any further assistance or information
required.

Sincerely,

Charles Murray
Compliance Representative

RE: Chief Management Corporation
Case Number 200033223
F.O. #A381046
#2011245; #500 Broadway, New York Ave., Chicago Plus Building, Chicago

Dear Charles Pearce:

Enclosed are the results for PDA screening analysis of the following Chief Management Corporation samples received at AmeriSci on February 21, 2002. See #33223 for information.

#1, #2, #3, #4, #5, #6, #7, #8, #9, #10, #11, #12, #13, #14, #15

The 15 samples submitted to the laboratory were shipped to AmeriSci as 1 item of evidence. These samples were analyzed using the PDA methodology as described in NIOSH Method 1400, Issue 22, 1/1/99. The following table lists the results of positive samples of the number of PDA sites which exceeded values within the limit. The total amount represents a quantity of the sites which exceed.

The model used (QD 1) is the specific analysis software as identified in the report. AmeriSci assumes no responsibility for the accuracy of the data used as "sample values" or "in sample results". This report shall not be used to make any conclusions or decisions by AmeriSci or any other third party agency. Complete analytical methodology is provided and available upon request. The scientific value of laboratory and technology information is provided. Information that is used shall not be reproduced, copied or full without the approval of the laboratory.

AmeriSci assumes no responsibility for any use of this information. Please contact our office for the complete report with any questions.

Sincerely,

Marjorie E. Brennan
Operations Supervisor

Dear Charles Foyers:

Enclosed are the results for PCM asbestos analysis of the following CNS Management Corporation samples received at AmeriSci on Wednesday, March 25, 2009, for a 24 hour turnaround:

48, 47, 46, 45, 50, 51, 52, 49, 53, 54, 55, 57, 58, 59

The 14 samples contained in Air Cassettes were shipped to AmeriSci via Hand Delivery. These samples were prepared according to PCM methodology as specified in NIOSH Method 7400, Issue #2, 8/12/94. The counting rules used are described in previous versions of this method as "A" rules unless otherwise noted within the report. The table attached represents a summary of the fiber count results.

This report relates ONLY to the sample analysis expressed as fibers/cm of filter area. AmeriSci assumes no responsibility for customer supplied data such as "sample location" or "air volume sampled". This report must not be used to claim product endorsement by AmeriSci or any AmeriSci certifying agency. Complete analytical documentation is provided and available upon written request. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

Marvin E. Brothers
Operations Supervisor

Reporting Notes:

(1) Fibers can be subjected for samples for testing with total volume by various methods (Method 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000, 1001, 1002, 1003, 1004, 1005, 1006, 1007, 1008, 1009, 1010, 1011, 1012, 1013, 1014, 1015, 1016, 1017, 1018, 1019, 1020, 1021, 1022, 1023, 1024, 1025, 1026, 1027, 1028, 1029, 1030, 1031, 1032, 1033, 1034, 1035, 1036, 1037, 1038, 1039, 1040, 1041, 1042, 1043, 1044, 1045, 1046, 1047, 1048, 1049, 1050, 1051, 1052, 1053, 1054, 1055, 1056, 1057, 1058, 1059, 1060, 1061, 1062, 1063, 1064, 1065, 1066, 1067, 1068, 1069, 1070, 1071, 1072, 1073, 1074, 1075, 1076, 1077, 1078, 1079, 1080, 1081, 1082, 1083, 1084, 1085, 1086, 1087, 1088, 1089, 1090, 1091, 1092, 1093, 1094, 1095, 1096, 1097, 1098, 1099, 1100, 1101, 1102, 1103, 1104, 1105, 1106, 1107, 1108, 1109, 1110, 1111, 1112, 1113, 1114, 1115, 1116, 1117, 1118, 1119, 1120, 1121, 1122, 1123, 1124, 1125, 1126, 1127, 1128, 1129, 1130, 1131, 1132, 1133, 1134, 1135, 1136, 1137, 1138, 1139, 1140, 1141, 1142, 1143, 1144, 1145, 1146, 1147, 1148, 1149, 1150, 1151, 1152, 1153, 1154, 1155, 1156, 1157, 1158, 1159, 1160, 1161, 1162, 1163, 1164, 1165, 1166, 1167, 1168, 1169, 1170, 1171, 1172, 1173, 1174, 1175, 1176, 1177, 1178, 1179, 1180, 1181, 1182, 1183, 1184, 1185, 1186, 1187, 1188, 1189, 1190, 1191, 1192, 1193, 1194, 1195, 1196, 1197, 1198, 1199, 1200, 1201, 1202, 1203, 1204, 1205, 1206, 1207, 1208, 1209, 1210, 1211, 1212, 1213, 1214, 1215, 1216, 1217, 1218, 1219, 1220, 1221, 1222, 1223, 1224, 1225, 1226, 1227, 1228, 1229, 1230, 1231, 1232, 1233, 1234, 1235, 1236, 1237, 1238, 1239, 1240, 1241, 1242, 1243, 1244, 1245, 1246, 1247, 1248, 1249, 1250, 1251, 1252, 1253, 1254, 1255, 1256, 1257, 1258, 1259, 1260, 1261, 1262, 1263, 1264, 1265, 1266, 1267, 1268, 1269, 1270, 1271, 1272, 1273, 1274, 1275, 1276, 1277, 1278, 1279, 1280, 1281, 1282, 1283, 1284, 1285, 1286, 1287, 1288, 1289, 1290, 1291, 1292, 1293, 1294, 1295, 1296, 1297, 1298, 1299, 1300, 1301, 1302, 1303, 1304, 1305, 1306, 1307, 1308, 1309, 1310, 1311, 1312, 1313, 1314, 1315, 1316, 1317, 1318, 1319, 1320, 1321, 1322, 1323, 1324, 1325, 1326, 1327, 1328, 1329, 1330, 1331, 1332, 1333, 1334, 1335, 1336, 1337, 1338, 1339, 1340, 1341, 1342, 1343, 1344, 1345, 1346, 1347, 1348, 1349, 1350, 1351, 1352, 1353, 1354, 1355, 1356, 1357, 1358, 1359, 1360, 1361, 1362, 1363, 1364, 1365, 1366, 1367, 1368, 1369, 1370, 1371, 1372, 1373, 1374, 1375, 1376, 1377, 1378, 1379, 1380, 1381, 1382, 1383, 1384, 1385, 1386, 1387, 1388, 1389, 1390, 1391, 1392, 1393, 1394, 1395, 1396, 1397, 1398, 1399, 1400, 1401, 1402, 1403, 1404, 1405, 1406, 1407, 1408, 1409, 1410, 1411, 1412, 1413, 1414, 1415, 1416, 1417, 1418, 1419, 1420, 1421, 1422, 1423, 1424, 1425, 1426, 1427, 1428, 1429, 1430, 1431, 1432, 1433, 1434, 1435, 1436, 1437, 1438, 1439, 1440, 1441, 1442, 1443, 1444, 1445, 1446, 1447, 1448, 1449, 1450, 1451, 1452, 1453, 1454, 1455, 1456, 1457, 1458, 1459, 1460, 1461, 1462, 1463, 1464, 1465, 1466, 1467, 1468, 1469, 1470, 1471, 1472, 1473, 1474, 1475, 1476, 1477, 1478, 1479, 1480, 1481, 1482, 1483, 1484, 1485, 1486, 1487, 1488, 1489, 1490, 1491, 1492, 1493, 1494, 1495, 1496, 1497, 1498, 1499, 1500, 1501, 1502, 1503, 1504, 1505, 1506, 1507, 1508, 1509, 1510, 1511, 1512, 1513, 1514, 1515, 1516, 1517, 1518, 1519, 1520, 1521, 1522, 1523, 1524, 1525, 1526, 1527, 1528, 1529, 1530, 1531, 1532, 1533, 1534, 1535, 1536, 1537, 1538, 1539, 1540, 1541, 1542, 1543, 1544, 1545, 1546, 1547, 1548, 1549, 1550, 1551, 1552, 1553, 1554, 1555, 1556, 1557, 1558, 1559, 1560, 1561, 1562, 1563, 1564, 1565, 1566, 1567, 1568, 1569, 1570, 1571, 1572, 1573, 1574, 1575, 1576, 1577, 1578, 1579, 1580, 1581, 1582, 1583, 1584, 1585, 1586, 1587, 1588, 1589, 1590, 1591, 1592, 1593, 1594, 1595, 1596, 1597, 1598, 1599, 1600, 1601, 1602, 1603, 1604, 1605, 1606, 1607, 1608, 1609, 1610, 1611, 1612, 1613, 1614, 1615, 1616, 1617, 1618, 1619, 1620, 1621, 1622, 1623, 1624, 1625, 1626, 1627, 1628, 1629, 1630, 1631, 1632, 1633, 1634, 1635, 1636, 1637, 1638, 1639, 1640, 1641, 1642, 1643, 1644, 1645, 1646, 1647, 1648, 1649, 1650, 1651, 1652, 1653, 1654, 1655, 1656, 1657, 1658, 1659, 1660, 1661, 1662, 1663, 1664, 1665, 1666, 1667, 1668, 1669, 1670, 1671, 1672, 1673, 1674, 1675, 1676, 1677, 1678, 1679, 1680, 1681, 1682, 1683, 1684, 1685, 1686, 1687, 1688, 1689, 1690, 1691, 1692, 1693, 1694, Day Authorized Representative -- Charles Powers

This license has been issued in accordance with applicable provisions of Article 38 of the Labor Law of New York State and of the New York State Codes, Rules and Regulations (12 NYCRR Part 56). It is subject to suspension or revocation for a (1) serious violation of state, federal or local laws with regard to the conduct of an asbestos project, or (2) demonstrated lack of responsibility in the conduct of any job involving asbestos or asbestos material.

This license is valid only for the contractor named above and this license or a photocopy must be prominently displayed at the asbestos project workplace. This license verifies that all persons employed by the licensee on an asbestos project in New York State have been issued an Asbestos Certificate, appropriate for the type of work they perform, by the New York State Department of Labor.

1.0 Introduction

CNS Management Corp. (CNS) was retained by Acadia P/A Sherman Avenue, LLC to complete the removal of three-Underground Storage Tanks (UST's) with subsequent soil and groundwater remediation at 4650 Broadway in New York, New York referred to hereafter as the "subject site". See Figure I: Site Location Map. Corrective action is required based upon findings of gasoline related contaminants within analytical results, discussed further herein. Note: upon notification of analytical results, CNS contacted the NYSDC and was issued spill # 09-02240.

Based on observations made within historical Sandborn Fire Insurance Maps, CNS identified gasoline UST's within the southwestern portion of the basement. CNS subsequently exposed the UST's via excavation and advanced test pits and groundwater monitoring wells to delineate the impacted area.

This Remedial Action Plan (RAP) is written to remediate gasoline-contaminated soil and groundwater in order to ascertain a "No Further Action" status by the NYSDC utilizing excavation and/or non-invasive oxidation chemical methods due to relevant analytical results identifying gasoline related contamination within soils and groundwater.

2.0 Field Activities

On Monday March 30 through Wednesday April 1 of 2009, CNS exposed the identified gasoline UST's and advanced a total of eleven test pits throughout the eastern and southern portions of the subject site in order to delineate the contamination plume. See Figure II: Test Pit Locations. During the advancement of test pits, the soil strata consisted of concrete atop of RCA fill at shallow depths and fine to coarse sandy loam to the average depth of 10' below ground surface (bgs) and clay at the depths of 11' to 12' bgs. Saturated soil or groundwater was encountered within the borings at depths of 5' to 10' bgs.

The excavated soils were continuously screened throughout the project utilizing a Photo-Ionization Detector (PID) where borings logs were generated noting odors, physical characteristics and detectable VOC chemical constituents. The PID utilized throughout the project was calibrated using both fresh air calibration (zero point) and single sensor calibration (second point). Single sensor calibration was conducted by applying a known amount of reference gas to each sensor. PID readings ranged between 0.00 through 1,153 parts per million (ppm).

A total of eighteen soil samples were collected and analyzed via 8260 and 8270 for Volatile Organic Compounds (VOC's) and Semi-Volatile Organic Compounds (SVOC's) utilizing SEARS protocols. As indicated in the table below, analytical results did not identify any SVOC's above the NYSDC RSCD's. VOC's were identified consisting of Benzene and Xylene related constituents above the NYSDC RSCD's within Test Pit numbers TP01, TP02, TP05, TP06 and TP10. See Appendix A: Test Pit - Laboratory Analytical Data Sheets.

In addition to the soil collected soil samples, CNS collected additional waste characterization samples for disposal purposes. Analytical results identified the soils as non-hazardous petroleum material that can be disposed at a Class II recycling facility. See Appendix B: Waste Characterization - Laboratory Analytical Data Sheets.

Sampling Date: 05/12/09 - 05/12/09							
Analyte	Concentration	TYPE 1 (1)	TYPE 2 (1)	TYPE 3 (1)	TYPE 4 (1)	TYPE 5 (1)	Overall VOCs Maximum Conc.

NYSD, 10/01 - 10/01
 NYSD, 10/01 - 10/01

From Tuesday May 5th through Thursday May 7th of 2009, CNS installed four groundwater monitoring wells. The monitoring wells were installed by CNS utilizing a truck-mounted hydraulic direct push geoprobe. Monitoring wells were constructed utilizing schedule 40 PVC tubing constructed with a six-foot screen to accommodate the identified shallow level groundwater aquifer at the depth of 3 through 9 feet bgs. Perforated material was poured beneath and around the well screen then sealed with bentonite to grade. See Figure III: Monitoring Well Locations.

On May 12, 2009 CNS collected groundwater samples from the installed wells and were analyzed via 8260 and 8270 for VOC's and SVOC's utilizing STARS protocols. As indicated in the table below, analytical results identified Benzene, Toluene and Xylene related constituents above the NYSDEC Groundwater Standards within all the sampled wells. See Appendix D: Monitoring Wells - Laboratory Analytical Data Sheets.

Sampling Date: 01/22/08						
Analyte	Concentration	MW-1	MW-2	MW-3	MW-4	NYSDEC Total Metals GW Maximum (ppb)
		(4' B.P.)	(4' B.P.)	(4' B.P.)	(4' B.P.)	
µg/l						
VOC	1,2,4-Trinitrobenzene	2000	100	1000	100	1
	1,3,5-Trinitrobenzene	500	50	500	50	1
	1,2-Dichloroethane	110	7.6	100	10	1
	Trichloroethylene	100	15	50	5	1
	m-Ac. Nitro	4000	50	1000	100	1
	Naphthalene	200	11	50	10	10
	n-Butylbenzene	11	ND	ND	ND	1
	n-Propylbenzene	100	10	100	10	1
	n-Xylene	400	20	100	20	1
	p-Chlorophenol	50	3.3	20	2.3	1
	1,2,4-Trinitrobenzene	4000	100	1000	100	1
Total	Naphthalene	100	10	50	ND	10

Note:
 NYSDEC GW Standards = New York State Department of Environmental Conservation (NYSDEC) Groundwater Standards/Criteria
 ND = None Detected above laboratory's Minimum Detection Limit or Below of analysis and estimation
 Concentrations exceeding the NYS Groundwater Standards are highlighted in bold in this table.
 µg/l = Parts per Billion

Based upon the findings of the investigation, CNS developed this Remedial Action Plan to be submitted to the NYSDEC for approval.

3.0 Remediation

It is CNS's opinion that proper phase delineation is completed; observations of relevance made during the investigation consist of gasoline odors within the sandy loam saturated zone (3'-7' bgs) soil strata; however analytical results did not identify contaminants above the NYSDEC RSCOs, with exception to the immediate area around the identified UST's. Groundwater is identified at the depths of 4-9' bgs and no gasoline product or sheets were identified.

In order to effectively remediate the site CNS proposes to remove the UST's with immediate soils and to utilize chemical oxidizer injections, as the methods of remediation to properly and effectively remediate the groundwater to achieve a NYSDEC "no further action" status via analytical results. See Figure IV: Contamination Phase Location Plan.

3.1 Compliance

All work to be performed on site will comply with but is not limited to the following standards:

1. NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation.
2. NYSDEC Spill Technology and Remediation Series (STARS) #1 Petroleum Contaminated Soil Guidance Policy.
3. United States Environmental Protection Authority (USEPA) Technical Standards and Corrective Action Requirements for the Owners and Operators of Underground Storage Tanks (CTR Title 40, Part 260).
4. ASTM D 5902 Standard Practice for Design and Installation of Ground Water Monitoring Wells.
5. USEPA 542-R-98-008 In-Situ Remediation Technology: In-Situ Chemical Oxidation.
6. USEPA SW846 Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

3.2 Underground Storage Tank Closure

The following procedures will be implemented and coordinated with the NYSDEC for the UST removal.

1. All product piping will be drained into the tank. The piping will then be removed.
2. All liquids and residues will be removed from USTs by using explosion proof or air driven pumps. Pump motors and suction hoses will be bonded to the tank or otherwise grounded to prevent electrostatic ignition hazards. It may be necessary to use a hand pump to remove the last few inches of liquid from the bottom of the tank. If a vacuum truck is used for removal of liquids or residues, the area of operation for the vacuum truck will be vapor-free. The truck will be located upwind from the tank and outside the path of probable vapor travel. The vacuum pump exhaust gases will be discharged through hose of adequate size and length downwind of the truck, tank, and building.
3. All fill pipes, return feed lines and other non-product lines except the vent line will be removed. The vent line will remain connected until the tank is purged. All other tank openings will be temporarily plugged so that all vapors will exit through the vent line during vapor-firing process.
4. All flammable vapors will be removed by one of the methods described below. These methods provide a means for temporary vapor freeing of the UST.
 - Flammable and combustible vapors may be purged with an inert gas such as carbon dioxide (CO₂) or nitrogen (N₂).
 - The vapors in the tank may be displaced by adding CO₂ to the tanks in an amount of at least 1.5 pounds per 100 gallons of tanks capacity.
 - Ventilation using an evacuator-type air mover usually driven by compressed air.
 - Ventilation with a diffused air blower.
5. The tank's atmosphere area will be regularly tested for flammable vapor concentrations until the tank is removed from the Site.
6. The tank's vapor space will be tested by placing the combustible gas indicator probe into the fill opening with the drop tube removed. Readings will be taken at the bottom, middle and upper portions of the tanks. The instrument shall be cleaned after each reading. Readings of 10% or less of the lower flammable limits will be obtained before the tank is considered safe for removal from the ground. OSHA requires a lower flammable limit of 10% or less prior to removing the tank from the ground.
7. Following venting of the UST, the tanks will be cut open and cleaned of any residual petroleum by a confined space certified person. The tank will be removed from the Site as promptly as possible after vapor freeing procedures have been completed.
8. The tank will be sent to a scrap dealer for recycling. Sufficient holes will be made in the tanks to render them unfit for reuse. A bill of sale will be used to transfer tank ownership.
9. All bottom sludge will be transferred to a vacuum truck and properly transported to a licensed disposal treatment facility.

During removal of the UST's, CNS personnel will be on-site to field screen disturbed soils if applicable with a PID for the presence of petroleum contamination. If soils are encountered that exhibit PID readings greater than 5ppm, or exhibit petroleum odors, the material will be excavated and stockpiled separately. The material will be placed on and covered with 10-mil polyethylene sheeting.

CNS will collect compliance end-point samples from the tank walls, bed areas and a composite sample will be collected from the stockpile soils. All collected samples will be sent to the laboratory for analysis.

under NYSDEC STARS protocols, as well as parameters required by the designated waste disposal facility. Once the laboratory results are available the proper disposal facility will be selected and the soil will be transported to the disposal facility in accordance with all local, state, and federal regulations. Non-hazardous regulated waste manifests will be prepared at the Site prior to transporting soils to the approved facility. The hauler will have all necessary permits and licenses to transport the material, including a NYSDEC 364 permit. All manifests will be signed at the facility to show receipt of the material.

3.3 Groundwater Remediation - Chemical Injection Application

CNS is seeking approval to inject a chemical oxidizer into the groundwater aquifer to remove any residual contaminants that may be above the NYSDEC RSCOs and Groundwater Standards. The oxidizer proposed by CNS is RegenOx® Remediation Products which effectively and rapidly destroys petroleum hydrocarbons in both soil and groundwater. The mechanisms by which RegenOx® operates are:

- Direct Oxidation: $C_nCl_m + 2 Na_2CO_3 + 3 H_2O_2 \rightarrow 2 H_2O + 2 CO_2 + 4 NaCl + 4 H_2O + 2 H_2CO_3$
- Free Radical Oxidation: Peroxy Radical (RO_2^{\cdot}), Hydroxyl Radical (OH^{\cdot}), Superoxide Radical ($O_2^{\cdot-}$). Hydrocarbons have many H^{\cdot} that will be oxidized to H_2O .

RegenOx® has been approved by the NYSDEC and has been rigorously tested in both the laboratory and the field on petroleum hydrocarbons (aliphatics and aromatics), gasoline oxygenates (e.g., MTBE), polycyclic aromatic hydrocarbons (e.g., naphthalene and phenanthrene) and chlorinated hydrocarbons (e.g., PCE, CE, TCA). See Appendix D: RegenOx® Product Information and Case Studies.

A Geoprobe™ with a Geoprobe™ GS2200 Injection machine will be used to inject the RegenOx® product. The RegenOx® application will be mixed within the GS2200 and injected into the subsurface at 1,850 psi through one-inch diameter injection rod which will achieve a 25' -diameter cone of influence. A total of 6,500 lbs of RegenOx® will be applied both within and around the contamination plume as per the manufacturer's specifications at three different vertical depths which will expand within and beyond the contamination plume over time. Note: another RegenOx® application may be required based upon progressive analytical results.

4.0 Quality Assurance / Quality Control

Appropriate Quality Assurance/Quality Control (QA/QC) procedures will be utilized during implementation of all field activities, including but not limited to use of disposable vinyl gloves during sampling. All equipment will be cleaned prior to the commencement of collecting each sample and at the end of each work day.

5.0 General Health & Safety Plan

All activities associated will be conducted in accordance with appropriate recognized Health and Safety procedures. A site specific HASP will be prepared to ensure the safety of site personnel during all phases of the RAP implementation.

6.0 Notification and Access

Written notification will be provided to the NYSDEC in the form of e-mail or letter at least one (1) week in advance of such activities, in order that the NYSDEC may be present.

7.0 Monitoring Plan

7.1 Sampling Process Design

Following is a brief summary of sample collection activities. CNS will mark out and install both upgradient and downgradient wells extending to 20' radial distances from the identified contamination. CNS will then extend subsurface borings utilizing the truck mounted drill rig to depths of approximately 15 feet bgs. The wells will be purged and sampled by an experienced CNS sampling crew. Water level measurements will be collected periodically and synoptically in each of the wells to determine the direction of groundwater flow. Water level measurements and groundwater sampling procedures are provided in Section 10.0.

7.2 Logistics

Unencumbered access to the site with the soil removal equipment is expected to be available.

7.3 Soil Screening

All soil samples will be screened using a PID (11.7 eV lamp) and logged by a CNS personnel for geologic characteristics. All field equipment will be calibrated prior to use according to the manufacturer's instructions. The results of calibrations and any records of repair will be maintained in the field book. Equipment that fails calibration or fails to operate properly will be removed from service and segregated from the operational equipment. Such equipment will be repaired and re-calibrated if possible, or replaced. Preventive maintenance of field equipment is performed according to the procedures indicated in the manufacturer's manuals.

7.4 Sampling Methods Requirements

The CNS Project Manager will be responsible for ensuring that appropriate sample collection procedures are followed and will take appropriate actions to correct any identified deficiencies. All samples collected will be maintained under chain-of-custody and stored and shipped in laboratory-supplied coolers.

7.4.1 Groundwater

One-inch diameter monitoring wells will be installed. Based on the thickness of the perched water unit, it is anticipated that each well will consist of 10 feet of screen comparable to the existing monitoring wells. The top of each well casing will be surveyed to a common datum and tied into the existing monitoring well network. No monitoring wells will be installed in the sand below the confining layer. These borings will be grouted with bentonite slurry immediately after completion. A mill slot sampler with 3/8 inch polyethylene tubing and a peristaltic pump will be used to collect the groundwater samples. At the new monitoring well locations a soil boring will be drilled using a Geoprobe™ equipped with 2-inch diameter macro-core sampler, and soil samples will be collected continuously from grade to the water table or a depth of six feet, whichever is deeper. Once the appropriate depth is achieved a one-inch diameter PVC well point will be installed in the open borehole (one foot of 0.81 slot screen and solid riser). The annular space between the borehole and the well point will be backfilled with Morie sand to a depth of one foot above the top of the screen. A one-foot thick hydrated bentonite seal will be installed above the sand and the remainder of the annular space will be backfilled with native soils. Well points will be completed at grade with a small diameter flush-mount manhole and concrete seal.

As outlined within the groundwater sampling procedures provided in Section 10.0, CNS will measure water levels and collect groundwater samples from monitoring wells using low-flow sampling methods. Prior to sampling, each well will be purged a minimum of three casing volumes using a peristaltic pump with per-well dedicated tubing set in the middle of the well screen. This is performed to ensure representative samples from the formation surrounding the wells and to eliminate standing water in the wells. Temperature, pH, dissolved oxygen, turbidity and conductivity measurements will be collected and recorded after the removal of each casing volume. Well sampling logs will be prepared. A designated measuring point on the top of each well casing will be surveyed vertically to a common datum. It is anticipated that three rounds of water level data will be collected from the seven wells. The data will be presented in a table and groundwater elevation contour maps generated for each round. Groundwater samples will be analyzed for VOCs by EPA Method 8260 STARS protocols. Groundwater for VOCs analysis will be preserved by acidification to a pH of ≤ 2 using hydrochloric acid (HCl), cooled to 4°C, and maintained at this temperature until time of analysis. Immediately following collection of the samples, they will be placed in a cooler with "freezer-pots" in order to maintain sample integrity, all volatile sample bottles to be filled to capacity with no headspace for volatilization. If necessary to meet a maximum recommended holding time, the samples are to be shipped by overnight courier to the laboratory.

7.5 Sampling Equipment Decontamination

It is anticipated that dedicated sampling equipment will be used at all locations. However if not the case for some reason all sampling equipment will be cleaned between sampling locations to prevent cross contamination. All reusable sampling equipment that comes in contact with soil samples will be decontaminated prior to each sample by using the following steps:

1. Detergent (Alconox) solution wash
2. Potable water rinse
3. Detergent (Alconox) solution wash
4. Potable water rinse
5. Solvent rinse (methanol)
6. Deionized water rinse

7.6 Sample Handling and Custody Requirements

This section describes sample identification and chain-of-custody procedures that will be used for field activities. The purpose of these procedures is to ensure that the quality of samples is maintained during collection, transportation, storage, and analysis.

7.6.1 Sample Containers – Soil

The sample container, preservation, and holding time requirements for each sample matrix will meet the specified standards for analytical EPA Method 8260. The containers for the soil samples are 4 oz., wide mouth, straight-sided, flat glass jars (70mm neck finish) with Teflon lids. The holding time for VOCs in soils is 14 days. CNS has requested a normal turnaround time of 5-7 business days from the lab. All soil samples will be shipped the same day they are obtained to the analytical laboratory. The samples must be stored at or near 4°C and analyzed within specified holding times. The laboratory will meet the specifications for documentation, data reduction and reporting. The laboratory will follow all method specifications pertaining to sample holding times contained in the specific analytical method. Screening

analysis will be carried out using USEPA Method OL5004.0 and the analytical laboratory will adhere to required QA/QC procedures.

7.6.2 Sample Containers – Water

Groundwater samples will be analyzed by EPA Method 8260 STARS Protocols. The containers will be two 40 ml. VOA vials per sample. The holding time for VOCs is 14 days. All soil samples will be shipped the same day they are obtained to the analytical laboratory for VOC analysis. The laboratory will follow all method specifications pertaining to sample holding times contained in the specific analytical method. Screening analysis will be carried out using USEPA Method OL5004.0 and the analytical laboratory will adhere to required QA/QC procedures.

7.6.3 Sample Labels

A sample label will be attached to each sampling container prior to the sampling event. Information to be included on the label will include the following:

- Sample number
- Date and time of sample collection
- Initials of person collecting the sample
- Project number
- Type of preservative, if any.

Individual samples will be identified using a unique sample number that includes the prefix for a location code. Refer to the attached table for sample numbering.

7.6.4 Chain-of-Custody Record and Shipment

There will be no preservatives added in the field. All samples will be transferred to the appropriate sampling containers and placed into a chilled (40C) transport container for shipment to the laboratory. The chilled transport containers (coolers) will be utilized for temporary storage of the samples. The laboratory will provide sampling containers and coolers. The shipping container used will be designed to prevent breakage, spills and contamination of the samples. Tight packing material is to be provided around each sample container and any void around the "freezer-pack". The container is to be securely sealed, clearly labeled, and accompanied by a COC record. Separate shipping containers should be used for "clean" samples and samples suspected of being heavily contaminated. During winter months, care should be taken to prevent samples from freezing. Sample bottles will not be placed directly on "freezer-packs". Chain-of-custody (COC) procedures will be followed from the time of sample collection to the conclusion of laboratory analysis.

Field COC procedures include:

- Label containers with sample location and sample information plus the intended analytical parameter(s). Date, time and sampler information will be written on the label in the field.
- Complete chain-of-custody forms for all samples en route to laboratory. Upon transferring samples to the laboratory sample custodian, designated staff will sign, date and note the time of transfer on the chain-of-custody form.
- Ship samples in ice chest sealed with custody seals, unless relinquished directly to a laboratory representative. The laboratory sample custodian confirms the integrity of the seals at the laboratory.

- Ensure that the samples are in possession or view of field staff or in secure storage at all times.
- Transport samples to the laboratory as soon as possible, observing appropriate preservation and holding-time requirements.

Upon receipt of the samples at the laboratory, the laboratory sample custodian will inventory the samples by comparing sample labels to those on the COC document. The custodian will enter the sample number into a laboratory tracking system by project code and sample designation. The custodian will assign a unique laboratory number to each sample and will be responsible for distributing the samples to the appropriate analyst or for storing samples in an appropriate secure area.

7.9 Analytical Methods

Soil and groundwater samples will be collected in accordance with USEPA "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (SW-846) and analyzed for VOCs in accordance with NYSDEC STARS protocol utilizing USEPA Method 8260. All of the collected samples will be placed in laboratory-supplied glassware, packed in ice-filled coolers accompanied by chain-of-custody documentation and transported to a NYSDEC-certified laboratory.

7.10 Equipment Calibration and Maintenance Procedures

All field equipment will be calibrated prior to use according to the manufacturer's instructions. The results of calibrations and any records of repair will be maintained in the field book. Equipment that fails calibration or fails to operate properly will be removed from service and segregated from the operational equipment. Such equipment will be repaired and re-calibrated if possible, or replaced. Preventive maintenance of field equipment is performed according to the procedures indicated in the manufacturer's manuals. Laboratory analytical equipment and instruments will be calibrated in accordance with the laboratory's internal quality assurance/quality control (QA/QC) program.

7.11 Quality Control Samples

Duplicate aqueous samples will be collected and analyzed to check laboratory reproducibility of analytical data. Duplicate samples will be collected at a frequency of at least 5% (one out of every 20 samples) of the total number of samples collected to evaluate the precision and reproducibility of the analytical methods. All duplicate samples will be submitted to the analytical laboratory as a "blind duplicate", having a fictitious sample identification name and time of sample collection. Each blind duplicate will be cross-referenced to document which real sample it is a duplicate of in the field notes and on the master sample log. Because soil sampling will be conducted, QC field samples proposed for this investigation are duplicates, matrix spike, and matrix spike duplicates. Laboratory QC will include calibration standards, laboratory control samples, reagent blanks, surrogate spikes, and laboratory duplicates.

8.0 Data Validation and Usability

All field data will be summarized and recorded in the project-specific field book. Descriptive data including soil types, field screening results and observations will be summarized in an appropriate format. The analytical laboratory will conduct necessary QC calculations that will be summarized in final laboratory reports. Copies of the analytical data will be provided to the NYSDEC for review. An electronic copy is desirable but paper copy is acceptable. All final laboratory reports will be included as an appendix or appendices to the final report. All analytical data will also be summarized in tabular form.

Analytical data will be assessed to ensure that they are of acceptable quality. This assessment will include a review of the following:

- Sampling dates
- Dates of analysis
- Requested analysis
- Chain-of-Custody documentation
- Sample preservation
- Holding times
- Method blanks
- Surrogate recoveries
- Laboratory duplicates
- Field duplicates
- Laboratory control samples
- Method reporting limits above requested levels
- Any additional comments or difficulties reported by the laboratory
- Overall laboratory assessment of data quality

Following data validation (if conducted) and reporting, all project-generated and compiled data and information will be reconciled with the project objectives to assess the overall success of sampling activities. This data assessment, including points of achievement and departures from project - specific objectives, will be discussed in the QA section of the final report.

9.0 Data Management and Reporting Plan

9.1 Data Presentation Formats

Project data will be presented in consistent formats for all letters, quarterly progress reports, interim technical reports, and draft/final technical reports. Specific formats will be tailored to best fit the needs of the data being presented but general specifications are described below.

9.2 Data Records

The data records will generally include one or more of the following:

- Unique sample or field measurement code;
- Sampling or field measurement location and sample or measurement type;
- Sampling or field measurement raw data
- Laboratory analysis ID number;
- Property or component measured; and
- Result of analysis (e.g., concentration)

9.3 Tabular Displays

The following data may be presented in tabular displays:

- Unsorted (raw) data;
- Results for each constituent;
- Data reduction for statistical analysis;
- Sorting of data by potential stratification factors (e.g., location, depth, topography, etc); and
- Summary data.

9.4 Graphical Displays

The following data may be presented in graphical formats (e.g., bar graphs, line graphs, area or plan maps, isopleth plots, cross-sectional plots or transects, three dimensional graphs, etc.):

- Sample location and sampling grid.
- Boundaries of sampling area.
- Constituent concentrations at each sample location.
- Geographical extent of impacts.
- Constituent concentration levels.

10.0 Groundwater Monitoring: Sampling Procedures & Protocols

The wells will be initially monitored and groundwater samples will be analyzed by a NYSDOH-certified laboratory and deliverables would conform to NYSDEC ASP Category II. As part of the reporting process, all data will be evaluated and recommendations for modifications in the frequency of sampling and number of wells to be sampled will be presented. Construction details for the monitoring wells are outlined in Section 3.0.

10.1 Groundwater Sampling Protocols

During each round of sampling, groundwater samples will be collected from the monitoring wells, using the low flow well sampling techniques described herein. Prior to a sampling round, water levels will be measured in all monitoring wells. These water level data will be collected on a single date, prior to the field sampling, and will be tabulated and used to compile groundwater contour maps. Three to five well casing volumes will be purged using a low flow subsurface pump and disposable polyethylene tubing or by bailer. Field measurements of pH, specific conductance, and temperature will be collected and documented. Specific conductance, pH, and temperature will be measured at a minimum after each purged volume. Stabilization of these parameters $\pm 10\%$ from successive purged volumes indicates that the groundwater within the well is at or approaching equilibrium and the well can be subsequently sampled. A stainless steel, Teflon, PVC, or polyethylene bailer will be used to obtain the groundwater samples. Samples must be collected within three (3) hours of purging. All samples will be sent to the laboratory for analysis within 24 hours of sampling. The following standard protocol for groundwater sampling has been established to conform to NYSDEC rules and regulations. The standard methods for preparation, collection and transfer of groundwater samples, as well as record keeping, are detailed below. These methods must be followed to provide representative samples of chemical analysis. After collection of an acceptable sample in accordance with this protocol, the sample will be submitted to a NYSDOH ELAP certified laboratory. The preparation, collection, preservation, transfer and record keeping of each sample will be coordinated with the analytical laboratory to ensure reliable test results.

10.2 Sampling Periods

The wells will be monitored and the groundwater samples will be analyzed for EPA Method 8160 STARS protocols constituents by a NYSDOH-certified laboratory and deliverables would conform to NYSDEC ASP Category II. As part of the reporting process, all data will be evaluated and recommendations for modifications in the frequency of sampling and number of wells to be sampled will be presented.

10.3 Pre-Sampling Preparation Equipment

- **Health and Safety:** The health and safety protocols for sample collection will conform to typical Level D industry standards.
- **Authorized Personnel:** All individuals involved in the sampling will have read this Plan, be technically qualified, and follow the protocol whenever groundwater samples are obtained.
- **Staging:** Prior to any sampling event, personnel will take the following steps responsible for sampling:
 1. Review the sampling procedures;
 2. Assemble and inspect field equipment necessary for sample collection, and verify that equipment is clean and in proper working order;
 3. Calibrate equipment to the manufacturer's specifications;
 4. Examine shuttles, bottles and preservatives. Contact the laboratory immediately if any problems are found or observed.
 5. Confirm sample delivery time and method of sample shipment with the laboratory;
 6. Establish a well purging and sampling schedule for the activities to be performed each day; and
 7. Establish a temporary staging area consisting of plastic sheeting.

10.4 Groundwater Level Measurement Procedures

- Clean all water-level measuring equipment (e.g., steel tape or water level indicator) using appropriate decontamination procedures.
- Remove locking well cap, note weather, time of day and date, etc. in field notebook, or on an appropriate form.
 1. Remove well casing cap.
 2. Measure the static water level in the well with a decontaminated steel tape or electronic water level indicator. The tape or water level indicator shall be rinsed with deionized water in between individual wells to prevent cross-contamination. Synoptic rounds of water level measurements shall all be completed in the same day.
 3. Measure distance from water surface to reference measuring point on well casing, and record in field notebook. (Note that the measurement is being taken from the established survey reference mark (notch) located at the top of the PVC riser pipe in each well.)
 4. Measure total depth of well and record in field notebook or on log form. All water level measurements are to be recorded to the nearest 0.00-foot.
 5. Remove all down hole equipment, replace and secure well casing cap and locking protective caps.
 6. Calculate elevation of water: $EW = E - D$
Where:
EW = Elevation of water;
E = Elevation of point of measurement (i.e., survey reference point); and
D = Depth to water

10.5 Procedures for Well Purging

Well purging is necessary to obtain a sample representative of the groundwater in the formation and not standing/stagnant water in the well.

- Examination of the well
 1. Identify the well and record the well number of the field data sheet.
 2. Verify that the well is not damaged. Notify the Project Manager if well damage is obvious or suspected, so that the well can be repaired or replaced.
 3. Put on new disposable gloves.
 4. Carefully remove well cover to avoid entry of foreign material into well.
 5. If needed, the exterior and interior of the exposed protective well box should be wiped with clean filter paper (or equivalent) wetted with distilled water.
- Purging the Well
 1. Three to five casing volumes of water will be removed from the well prior to sampling with either a submersible pump and dedicated polyethylene tubing, or with a dedicated bailer, or properly decontaminated bailer (stainless steel, Teflon or PVC). The well volume is calculated using the following formula: $V = \pi R^2 (H)(0.49)$
Where:
 V = standing water volume, in gallons, to be purged
 R = inside radius of well in inches
 H = linear feet of standing water in the casing (total depth to groundwater)
 0.49 = correction factor that includes conversion from inches to feet and assumes three well volumes will be purged
OR:
purge until water temperature, conductivity and pH stabilize (i.e., remain constant within 10% of each reading). If a well purges dry or is slow to recharge, only one well volume of water needs to be purged.
 2. Temperature, specific conductance, and pH will be measured during purging. At a minimum, measurements will be taken after each well volume purged.
 3. All purging and sampling equipment must be stored and transported in a manner that minimizes the possibility of accidental contamination.

10.6 Procedures for Record Keeping

The sampling team will record the following information regarding the well purging procedure in the field notebook and/or on a Groundwater Sampling Record/Field Observation Log.

- Date and time
- Weather conditions
- Air temperature
- Condition of the well (risky, bent casing, etc.)
- Person(s) doing the purging
- Groundwater level prior to purging
- Depth to the bottom of the well
- Minimum volume of groundwater to be purged (3 well volumes)
- Chemical properties of evacuated water: temperature, specific conductance, pH
- Method of purge water disposal
- Physical properties of evacuated water: Color, odor, turbidity, presence of steam
- Volume of groundwater purged from the well.

The following field measurement procedures that discuss specific steps in the calibration and use of field instruments should be interpreted to reflect the manufacturer's recommended procedures for the actual instruments being utilized.

10.7 Procedures for the Measurement of Groundwater pH and Temperature

10.7.1 Calibration

1. Immerse the tip of the electrode in water overnight. If this is not possible due to field conditions, immerse the electrode tip in water for at least an hour before use.
2. Rinse the electrode with demineralized water.
3. Immerse the electrode in pH 7 buffer solution.
4. Adjust the temperature compensator to the proper temperature.
5. Adjust the pH meter to read 7.0.
6. Remove the electrode from the buffer and rinse with demineralized water.

10.7.2 Measurement

1. Collect a groundwater sample using either a stainless steel, Teflon or PVC boiler and pour a small amount of this sample into an extra sample jar that will not be used to store chemically analyzed samples.
2. Immerse the electrode into the extra sample jar. Do not immerse the electrode into a sample that will be analyzed by the laboratory.
3. Read and record the pH of the solution after adjusting the temperature compensator to the sample temperature.
4. Rinse the electrodes with demineralized water.
5. Keep the electrode immersed in demineralized water when not in use.
6. Record Results in the field notebook.

10.8 Procedure for the Measurement of Groundwater Specific Conductance

1. Immerse the electrode in water overnight. If this is not possible due to field conditions, immerse the electrode for at least an hour before use.
2. Rinse the cell with one or more portions of the sample to be tested.
3. Immerse the electrode in the sample and measure the conductivity.
4. Adjust the temperature setting to the sample temperature.
5. Record the results in the field notebook.

10.9 Procedures for Groundwater Sampling

1. The following procedure shall be used for monitoring well groundwater sampling.
2. Prepare for purging. Decontaminate bailer and discard rope. If a submersible pump is used, discard pump discharge line. If using a disposable bailer and dedicated rope, prepare new bailer and appropriate length of rope.
3. After purging, allow static water level to recover for ten minutes.
4. Obtain sample from well with either a stainless steel, Teflon, PVC or disposable bailer suspended on either a polypropylene monofilament or a stainless steel, coated-coated wire. The maximum time between purging and sampling will be three (3) hours.
5. Lower the bailer slowly to avoid degassing.
6. Collect samples by pouring bailers directly into sample bottles from bailers.
7. Place samples in cooler and chill to 4°C. Samples will be delivered to the designated laboratory within 24 hours.

8. Re-lock well cap.
9. Fill out field notebook, well sample log sheet, labels, custody seals and chain-of-custody forms.

10.10 Field Procedures Documentation

Data reporting practices will be followed carefully and data entries will be validated regularly to ensure that raw data are accurate. All the field data generated during field measurements, observations and field instrument calibrations, will be entered directly into a bound field notebook. One or more bound books will be maintained for the site, and each book will be consecutively numbered. The books will remain with the main project files. Copies will be made for the Project Manager and for the person who made the entries, if requested. All entries in the logbook will be made in ink. When a mistake is made in the log, it will be crossed out with a single ink line and will be initialed and dated. Special care will be taken in the description and documentation of sampling procedures. Sampling information to be documented in the field notebook and/or associated forms are as follows:

- Weather conditions;
- Sample number;
- Date and time of sample collection;
- Source of sample (well, trench, etc.);
- Purged well – type of equipment, purge volume, rate of purge, decontamination procedures and method of disposal;
- Location of sample – document with a site sketch and/or written description of the sampling location so that accurate re-sampling can be conducted if necessary;
- Sampling equipment (i.e. bailer);
- Analysis and QA/QC required;
- Filtering, if required;
- Field instrument calibration including date of calibration, standards used and their source, results of calibration and any corrective actions taken;
- Field data (pH, temperature, conductivity, etc.);
- Field observations – all significant observations will be documented;
- Sample condition (color, odor, turbidity, etc.);
- Site conditions;
- Sample shipping procedure, date, time, destination, and if legal seals were attached to transport container(s);
- Comments – Any observation or event that occurred that would be relevant to the site; for example weather changes and effect in sampling.

10.11 Corrective Action

If, during the course of sampling, it is determined that field procedures are not yielding representative groundwater samples, this Plan will be modified as required and reported to the Project Manager and the NYSDEC. Any alteration to field procedures will be included as an amendment to the Plan.

10.12 Selected Laboratory and Sample Analysis

Soil and groundwater samples will be analyzed by a NYSDEC-certified laboratory. After installation the well points will be allowed rest a minimum of twenty four hours prior to sampling to allow the point to equilibrate to surrounding pressures. These monitoring wells will be sampled and sent to the lab the same day to ensure accuracy. Soil sampling will be performed for the purpose of classifying soils and

determining the presence of groundwater. No soil samples will be submitted for laboratory analysis, although samples will be screened for volatile organics using a PID or equivalent.

11.0 Implementation and Schedule

Field activities will commence within ten (10) days of authorization to proceed. We estimate the laboratory analysis will take approximately five (5) to seven (7) days, respectively. Reports will take approximately two (2) to four (4) weeks upon completion of site work.

12.0 Signatures

This Amended RAP was conducted and reported in accordance with industry-accepted practices, American Society for Testing and Materials (ASTM) Standard E1527-06 and E1903-07(2007), the New York State Department of Environmental Conservation's (NYSDEC) "Spill Guidance Manual – Site Investigation Procedures" and draft document "DE2-10 – Technical Guidance for Site Investigation and Remediation (12/07) and the United States Environmental Protection Authority's (USEPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846).

1 - This parameter is not verified by NY NELAP in this matrix. NY NELAP does not offer certification for all parameters.

Comments:

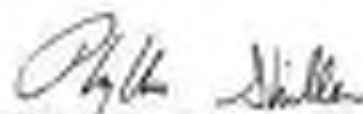

Conductivity is based solely on the pH analysis performed above.

Stability is based solely on the results of the closed-loop Redox analysis performed above.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Oxygen and Reactive Sulfide. This method is no longer listed in the current version of SW 846.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

1 - This parameter is not verified by NY NELAP for this matrix. NY NELAP does not offer verification for all parameters.

Comments:

Conductivity is based solely on the pH analysis performed above.

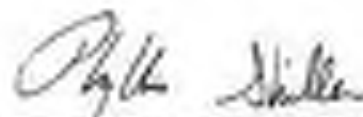

Reliability is based solely on the results of the Standard Endpoint analysis performed above.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Oxygen and Reactive Sulfide. This method is no longer listed in the current version of SW 846.

Delayed reporting limits for volatiles due to the presence of non-target compounds.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

ND=Not detected ECL=Below Detection Level RL=Reporting Level

1 - This parameter is not verified by NY NELAP for this matrix. NY NELAP does not offer verification for all parameters.

Comments:

*Toluene/hydrocarbon/phenanthrene was not a perfect match with any of the standards, but most closely resembles diesel fuel (fuel #2).

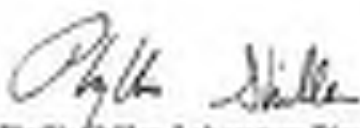

Conductivity is based solely on the pH analysis performed above.

Stability is based solely on the results of the standard/endpoint analysis performed above.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Oxygen and Reactive Sulfide. This method is no longer listed in the current version of SW-846.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

1 - This parameter is not verified by NY NELAP for this matrix. NY NELAP does not offer verification for all parameters.

Comments:

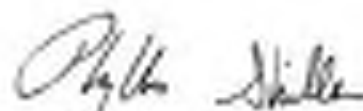

Conductivity is based solely on the pH analysis performed above.

Reliability is based solely on the results of the Standard Endpoint analysis performed above.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Oxygen and Reactive Sulfide. This method is no longer listed in the current version of SW 846.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

1 - This parameter is not verified by NY NELAP for this matrix. NY NELAP does not offer verification for all parameters.

Comments:

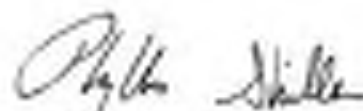

Conductivity is based solely on the pH analysis performed above.

Reliability is based solely on the results of the Standard Endpoint analysis performed above.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Oxygen and Reactive Sulfide. This method is no longer listed in the current version of SW 846.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

1 - This parameter is not verified by NY NELAP for this matrix. NY NELAP does not offer verification for all parameters.

Comments:

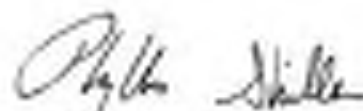

Conductivity is based solely on the pH analysis performed above.

Reliability is based solely on the results of the Standard Endpoint analysis performed above.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Oxygen and Reactive Sulfide. This method is no longer listed in the current version of SW 846.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

1 - This parameter is not verified by NY NELAP for this matrix. NY NELAP does not offer verification for all parameters.

Comments:

**Freekernhydrocarbon chromatogram was not a perfect match with any of the standards, but most closely resembles diesel fuel #1 and #2.

Conductivity is based solely on the pH analysis performed above.

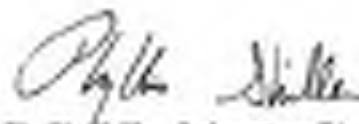

Ignitability is based solely on the results of the closed-cup flashpoint analysis performed above.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Organics and Reactive Solids. This method is no longer listed in the current version of SW-846.

Elevated reporting limits for volatiles due to the presence of non-target compounds.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

1 - This parameter is not verified by NY NELAP for this matrix. NY NELAP does not offer verification for all parameters.

Comments:

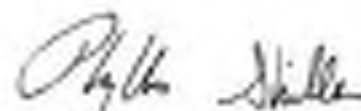

Correctivity is based solely on the pH analysis performed above.

Reliability is based solely on the results of the Standard Endpoint analysis performed above.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Oxygen and Reactive Sulfide. This method is no longer listed in the current version of SW 846.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

QA/QC Report

April 10, 2009

QA/QC Data

SDG I.D.: GAR50397

Parameter	Blank	Dup	LCS	LCSD	LCS	MS	MS Dup	RPD
		RPD	%	%	RPD	Rec %	Rec %	
QA/QC Batch 123996, QC Sample No: AR50397 (AR50397, AR50398, AR50399, AR50400, AR50401, AR50402, AR50403, AR50404)								
pH - Soil		3.10	99.8					
QA/QC Batch 124043, QC Sample No: AR50397 (AR50397, AR50398, AR50399, AR50400, AR50401, AR50402, AR50403, AR50404)								
Reactivity - Cyanide	BDL	NC	95.7					
QA/QC Batch 124292, QC Sample No: AR51267 (AR50399, AR50404)								
Fresh Paint		NC	Passed					

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

- RPD - Relative Percent Difference
- LCS - Laboratory Control Sample
- LCSD - Laboratory Control Sample Duplicate
- MS - Matrix Spike
- MS Dup - Matrix Spike Duplicate
- NC - No Criteria

RegenOx® Product Information and Case Studies

RegenOx™

CHEMICAL OXIDATION REDEFINED...

RegenOx™ is an advanced *in situ* chemical oxidation technology* designed to treat organic contaminants including high concentration source areas in the saturated and vadose zones

PRODUCT FEATURES:

- Rapid and sustained oxidation of target compounds
- Easily applied with readily available equipment
- Destroys a broad range of contaminants
- More efficient than other solid oxidants
- Enhances subsequent bioremediation
- Avoids detrimental impacts to groundwater aquifers

RegenOx product applicator

HOW IT WORKS:

RegenOx maximizes *in situ* performance using a solid alkaline oxidant that employs a sodium percarbonate complex with a multi-part catalytic formula. The product is delivered as two parts that are combined and injected into the subsurface using common drilling or direct-push equipment. Once in the subsurface, the combined product produces an effective oxidation reaction comparable to that of Fenton's Reagent without a violent exothermic reaction. RegenOx safely, effectively and rapidly destroys a wide range of contaminants in both soil and groundwater (Table 1).

ACHIEVES RAPID OXIDATION VIA A NUMBER OF MECHANISMS

RegenOx directly oxidizes contaminants while its unique catalytic complex generates a suite of highly charged, oxidative free radicals that are responsible for the rapid destruction of contaminants. The reactions by which RegenOx operates are:

- Surface-Mediated Oxidation (see Figure 1 and description below)
- Direct Oxidation: $C_2Cl_4 + 2 Na_2CO_3 + 5 H_2O + 2 H_2O \leftrightarrow 2CO_2 + 4 NaCl + 4 H_2O + 2 H_2CO_3$
- Free Radical Oxidation:
 - Peroxymethyl Radical ($HO_2\cdot$)
 - Hydroxyl Radical ($OH\cdot$)
 - Superoxide Radical ($O_2\cdot^-$)

Figure 1. Surface-Mediated Oxidation is responsible for the majority of RegenOx contaminant destruction. This process takes place in two stages. First, the RegenOx activator complex coats the subsurface. Second, the oxidizer complex and contaminant react with the activator complex surface destroying the contaminant.

Figure 1. RegenOx™ Surface-Mediated Oxidation

* Patent applied for

RegenOx™

From Mass Reduction to Bioremediation:

RegenOx™ is an effective and rapid contaminant mass reduction technology. A single injection will remove significant amounts of target contaminants from the subsurface. Strategies employing multiple RegenOx injections coupled with follow-on accelerated bioremediation can be used to treat highly contaminated sites to regulatory closure. In fact, RegenOx was designed specifically to allow for a seamless transition to low-cost accelerated bioremediation using any of Regenesis' controlled-release compounds.

Significant Longevity:

RegenOx has been shown to destroy contaminants for periods of up to one month.

Product Application Made Safe and Easy:

RegenOx produces minimal heat and as with all oxidants proper health and safety procedures must be followed. The necessary safety guidance accompanies all shipments of RegenOx and additional resources are available on request. Through the use of readily available, highly mobile, direct push equipment and an array of pumps, RegenOx has been designed to be as easy to install as other Regenesis products like ORC® and HRC®.

Effective on a Wide Range of Contaminants:

RegenOx has been rigorously tested in both the laboratory and the field on petroleum hydrocarbons (aliphatics and aromatic), gasoline oxygenates (e.g., MTBE and TAME), polycyclic aromatic hydrocarbons (e.g., naphthalene and phenanthrene) and chlorinated hydrocarbons (e.g., PCE, TCE, TCA).

Oxidant Effectiveness vs. Contaminant Type:

Contaminant	RegenOx™	Fenton's Reagent	Potassium Permanganate	Persulfate	Activated Persulfate	Ozone
Petroleum Hydrocarbons	A	A	B	B	B	A
Benzene	A	A	D	B	B	A
MTBE	A	B	B	C	B	B
Phenols	A	A	B	C	B	A
Chlorinated Ethenes (PCE, TCE, DCE, VC)	A	A	A	B	A	A
Chlorinated Ethanes (TCA, DCA)	A	B	C	D	C	B
Polycyclic Aromatic Hydrocarbons (PAHs)	A	A	B	B	A	A
Polychlorinated Biphenyls (PCBs)	B	C	D	D	D	B
Explosives (RDX, HMX)	A	A	A	A	A	A

Based on laboratory kinetic data, thermodynamic calculations, and literature reports.

Oxidant Effectiveness Key:

- A = Short half life, low free energy (most energetically favored), most complete
- B = Intermediate half life, low free energy, intermediate degree of completion
- C = Intermediate half life, intermediate free energy, low degree of completion
- D = Long half life, high free energy (least favored), very low degree of completion

Regen OX – Part A (Oxidizer Complex)

Material Safety Data Sheet (MSDS)

Last Revised: November 7, 2005

Section 1 – Supplier Information and Material Identification

Supplier:

REGENESIS

1011 Calle Sorbus
San Clemente, CA 92673
Telephone: 949.366.8000
Fax: 949.366.8090
E-mail: info@regenesis.com

Chemical Description:	A mixture of sodium percarbonate $[2Na_2CO_3 \cdot 3H_2O_2]$, sodium carbonate $[Na_2CO_3]$, sodium silicate and silica gel.
Chemical Family:	Inorganic Chemicals
Trade Name:	Regen Ox – Part A (Oxidizer Complex)
Product Use:	Used to remediate contaminated soil and groundwater (environmental applications)

Section 2 – Chemical Information/Other Designations

<u>CAS No.</u>	<u>Chemical</u>
15670-89-4	Sodium Percarbonate
5968-11-6	Sodium Carbonate Monohydrate
1344-09-8	Silicic Acid, Sodium Salt, Sodium Silicate
63231-67-4	Silica Gel

Section 3 – Physical Data

Form:	Powder
Color:	White
Odor:	Odorless
Melting Point:	NA
Boiling Point:	NA

Section 3 – Physical Data (cont)

Flammability/Flash Point:	NA
Vapor Pressure:	NA
Bulk Density:	0.9 – 1.2 g/cm ³
Solubility:	Min 14.5g/100g water @ 20 °C
Viscosity:	NA
pH (3% solution):	~ 10.5
Decomposition Temperature:	Self-accelerating decomposition with oxygen release starts at 50 °C.

Section 4 – Reactivity Data

Stability:	Stable under normal conditions
Conditions to Avoid Incompatibility:	Acids, bases, salts of heavy metals, reducing agents, and flammable substances
Hazardous Decomposition Products:	Oxygen. Contamination with many substances will cause decomposition. The rate of decomposition increases with increasing temperature and may be very vigorous with rapid generation of oxygen and steam.

Section 5 – Regulations

TSCA Inventory Listed:	Yes
CERCLA Hazardous Substance (40 CFR Part 302)	
Listed Substance:	No
Unlisted Substance:	Yes
SARA, Title III, Sections 313 (40 CFR Part 372) – Toxic Chemical Release Reporting: Community Right-To-Know	
Extremely Hazardous Substance:	No
WHMIS Classification:	C, D2B
Canadian Domestic Substance List:	Appears

Section 6 – Protective Measures, Storage and Handling

Technical Protective Measures

- Storage:** Oxidizer. Store in a cool, well ventilated area away from all sources of ignition and out of the direct sunlight. Store in a dry location away from heat and in temperatures less than 40 °C.
- Keep away from incompatible materials and keep lids tightly closed. Do not store in improperly labeled containers.
- Protect from moisture. Do not store near combustible materials. Keep containers well sealed.
- Store separately from reducing materials. Avoid contamination which may lead to decomposition.
- Handling:** Avoid contact with eyes, skin and clothing. Use with adequate ventilation.
- Do not swallow. Avoid breathing vapors, mists or dust. Do not eat, drink or smoke in the work area.
- Label containers and keep them tightly closed when not in use.
- Wash hands thoroughly after handling.

Personal Protective Equipment (PPE)

- Engineering Controls:** General room ventilation is required if used indoors. Local exhaust ventilation, process enclosures or other engineering controls may be needed to maintain airborne levels below recommended exposure limits. Avoid creating dust or mists. Maintain adequate ventilation at all times. Do not use in confined areas. Keep levels below recommended exposure limits. To determine actual exposure limits, monitoring should be performed on a routine basis.
- Respiratory Protection:** For many conditions, no respiratory protection is necessary; however, in dusty or unknown conditions or when exposures exceed limit values a NIOSH approved respirator should be used.
- Hand Protection:** Wear chemical resistant gloves (neoprene, rubber, or PVC).

Section 6 – Protective Measures, Storage and Handling (cont)

Eye Protection:	Wear chemical safety goggles. A full face shield may be worn in lieu of safety goggles.
Skin Protection:	Try to avoid skin contact with this product. Chemical resistant gloves (neoprene, PVC or rubber) and protective clothing should be worn during use.
Other:	Eye wash station.
Protection Against Fire & Explosion:	Product is non-explosive. In case of fire, evacuate all non-essential personnel, wear protective clothing and a self-contained breathing apparatus, stay upwind of fire, and use water to spray cool fire-exposed containers.

Section 7 – Hazards Identification

Potential Health Effects

Inhalation:	Causes irritation to the respiratory tract. Symptoms may include coughing, shortness of breath, and irritation to mucous membranes, nose and throat.
Eye Contact:	Causes irritation, redness and pain.
Skin Contact:	Causes slight irritation.
Ingestion:	May be harmful if swallowed (vomiting and diarrhea).

Section 8 – Measures in Case of Accidents and Fire

After Spillage/Leakage:	Eliminate all ignition sources. Evacuate unprotected personnel and never exceed any occupational exposure limit. Shovel or sweep spill material into plastic bags or vented containers for disposal. Do not return spilled or contaminated material to the inventory.
Extinguishing Media:	Water
First Aid	
Eye Contact:	Flush eyes with running water for at least 15 minutes with eyelids held open. Seek a specialist.
Inhalation:	Remove affected person to fresh air. Seek medical attention if the effects persist.
Ingestion:	If the individual is conscious and not convulsing, give two-four cups of water to dilute the chemical and seek medical attention immediately. Do Not induce vomiting.

Section 8 – Measures in Case of Accidents and Fire (cont)

Skin Contact: Wash affected areas with soap and a mild detergent and large amounts of water.

Section 9 – Accidental Release Measures

Precautions:

Cleanup Methods: Shovel or sweep spill material into plastic bags or vented containers for disposal. Do not return spilled or contaminated material to the inventory.

Section 10 – Information on Toxicology

Toxicity Data

LD50 Oral (rat): 2,400 mg/kg
LD50 Dermal (rabbit): Min 2,000 mg/kg
LD50 Inhalation (rat): Min 4,580 mg/kg

Section 11 – Information on Ecology

Ecology Data

Ecotoxicological Information: NA

Section 12 – Disposal Considerations

Waste Disposal Method

Waste Treatment: Dispose of in an approved waste facility operated by an authorized contractor in compliance with local regulations.

Package (Pail) Treatment: The empty and clean containers are to be recycled or disposed of in conformity with local regulations.

Section 13 - Shipping/Transport Information

D.O.T. Shipping Name:	Oxidizing Solid, N.O.S. [A mixture of sodium percarbonate [2Na ₂ (CO ₃)·3H ₂ O], sodium carbonate [Na ₂ CO ₃], sodium silicate and silica gel.]
UN Number:	1479
Hazard Class:	5.1
Labels:	5.1 (Oxidizer)
Packaging Group:	III

Section 14 - Other Information

HMIS[®] Rating	Health - 1 (slight)	Reactivity - 1 (slight)
	Flammability - 0 (none)	Lab PPE - goggles, gloves, and lab coat

HMIS[®] is a registered trademark of the National Painting and Coating Association.

Section 15 - Further Information

The information contained in this document is the best available to the supplier at the time of writing, but is provided without warranty of any kind. Some possible hazards have been determined by analogy to similar classes of material. The items in this document are subject to change and clarification as more information become available. This document is intended only as a guide to the appropriate precautionary handling of the material by a properly trained person. Individuals receiving this information must exercise their independent judgment in determining its appropriateness for a particular purpose.

Regen OX – Part B (Activator Complex)
Material Safety Data Sheet (MSDS)

Last Revised: November 7, 2005

Section 1 – Supplier Information and Material Identification

Supplier:

REGENESIS

1011 Calle Sombra
San Clemente, CA 92673
Telephone: 949.366.8000
Fax: 949.366.8090
E-mail: info@regenesis.com

Chemical Description: A mixture of sodium silicate solution, silica gel and ferrous sulfate

Chemical Family: Inorganic Chemicals

Trade Name: Regen Ox – Part B (Activator Complex)

Product Use: Used for environmental remediation of contaminated soils and groundwater

Section 2 – Chemical Information/Other Designations

<u>CAS No.</u>	<u>Chemical</u>
1344-09-8	Silicic Acid, Sodium Salt, Sodium Silicate
63231-67-4	Silica Gel
7720-78-7	Ferrous Sulfate
7732-18-5	Water

Section 3 – Physical Data

Form:	Liquid
Color:	Blue/Green
Odor:	Odorless
Melting Point:	NA
Boiling Point:	NA
Flammability/Flash Point:	NA
Vapor Pressure:	NA

Section 3 - Physical Data (cont)

Specific Gravity	1.39 g/cm ³
Solubility:	Miscible
Viscosity:	NA
pH (3% solution):	11
Hazardous Decomposition Products:	Oxides of carbon and silicon may be formed when heated to decomposition.

Section 4 - Reactivity Data

Stability:	Stable under normal conditions.
Conditions to Avoid:	None.
Incompatibility:	Avoid hydrogen fluoride, fluorine, oxygen difluoride, chlorine trifluoride, strong acids, strong bases, oxidizers, alkalis, fiberglass, copper, brass, zinc, and galvanized containers.

Section 5 - Regulations

TSCA Inventory Listed:	Yes
CERCLA Hazardous Substance (40 CFR Part 302)	
Listed Substance:	No
Unlisted Substance:	Yes
SARA, Title III, Sections 302.303 (40 CFR Part 355) - Emergency Planning and Notification	
Extremely Hazardous Substance:	No
SARA, Title III, Sections 311.312 (40 CFR Part 370) - Hazardous Chemical Reporting: Community Right-To-Know	
Hazard Category:	Acute
SARA, Title III, Sections 313 (40 CFR Part 372) - Toxic Chemical Release Reporting: Community Right-To-Know	
Extremely Hazardous Substance:	No

Section 6 – Protective Measures, Storage and Handling

Technical Protective Measures

Storage:	Keep in a tightly closed container (steel or plastic) and store in a cool, well ventilated area away from all incompatible materials (acids, reactive metals, and ammonium salts). Store in a dry location away from heat and in temperatures less than 24 °C. Do not store in aluminum, fiberglass, copper, brass, zinc or galvanized containers.
Handling:	Avoid contact with eyes, skin and clothing. Avoid breathing spray mist. Use with adequate ventilation. Do not use product if it is brownish-yellow in color.

Personal Protective Equipment (PPE)

Engineering Controls:	General room ventilation is required if used indoors. Local exhaust ventilation, process enclosures or other engineering controls may be needed to maintain airborne levels below recommended exposure limits. Safety shower and eyewash station should be within direct access.
Respiratory Protection:	Use NIOSH-approved dust and mist respirator where spray mist exists. Respirators should be used in accordance with 29 CFR 1910.134.
Hand Protection:	Wear chemical resistant gloves.
Eye Protection:	Wear chemical safety goggles. A full face shield may be worn in lieu of safety goggles.
Skin Protection:	Try to avoid skin contact with this product. Gloves and protective clothing should be worn during use.
Other:	
Protection Against Fire & Explosion:	Product is non-explosive and non-combustible.

Section 7 – Hazards Identification

Potential Health Effects

Inhalation:	Causes irritation to the respiratory tract. Symptoms may include coughing, shortness of breath, and irritations to mucous membranes, nose and throat.
Eye Contact:	Causes irritation, redness and pain.
Skin Contact:	Causes irritation. Symptoms include redness, itching and pain.
Ingestion:	May cause irritation to mouth, esophagus, and stomach.

Section 8 – Measures in Case of Accidents and Fire

After Spillage/Leakage (small):	Mop up and neutralize liquid, then discharge to sewer in accordance with local, state and federal regulations.
After Spillage/Leakage (large):	Keep unnecessary personnel away, isolate hazard area and do not allow entrance into the affected area. Do not touch or walk through spilled material. Stop leak if possible without risking injury. Prevent runoff from entering into storm sewers and ditches that lead to natural waterways. Isolate the material if at all possible. Sand or earth may be used to contain the spill. If containment is not possible, neutralize the contaminated area and flush with large quantities of water.
Extinguishing Media:	Material is compatible with all extinguishing media.
Further Information:	
First Aid	
Eye Contact:	Flush eyes with running water for at least 15 minutes with eyelids held open. Seek a specialist.
Inhalation:	Remove affected person to fresh air. Give artificial respiration if individual is not breathing. If breathing is difficult, give oxygen. Seek medical attention if the effects persist.
Ingestion:	If the individual is conscious and not convulsing, give two-four cups of water to dilute the chemical and seek medical attention immediately. DO NOT induce vomiting.
Skin Contact:	Wash affected areas with soap and a mild detergent and large amounts of water. Remove contaminated clothing and shoes.

Section 9 - Accidental Release Measures

Precautions:**PPE:**

Wear chemical goggles, body-covering protective clothing, chemical resistant gloves, and rubber boots (see Section 6)

Environmental Hazards:

Sinks and mixes with water. High pH of this material may be harmful to aquatic life. Only water will evaporate from a spill of this material.

Cleanup Methods:

Pick-up and place in an appropriate container for reclamation or disposal. US regulations (CERCLA) require reporting spills and releases to soil, water and air in excess of reportable quantities.

Section 10 - Information on Toxicology

Toxicity Data**Sodium Silicate:**

When tested for primary eye irritation potential according to OECD Guidelines, Section 005, a similar sodium silicate solution produced corneal, eyelid and conjunctival irritation. Some eye irritation was still present 14 days after treatment, although the average primary irritation score has declined from 29.7 after 1 day to 4.0 after 14 days. When tested for primary skin irritation potential, a similar sodium silicate solution produced irritation with a primary irritation index of 3 to abraded skin and 0 to intact skin. Human experience confirms that irritation occurs when sodium silicates get on clothes at the collar, cuffs, or other areas where abrasion may exist.

The acute oral toxicity of this product has not been tested.

Ferrous Sulfate:

LD50 Oral (rat): 319 mg/kg not a suspected carcinogen.

Section 11 – Information on Ecology

Ecology Data

Economicological Information: Based on 100% solid sodium silicate, a 96 hour median tolerance for fish of 2,320 mg/L; a 96 hour median tolerance for water fleas of 247 mg/L; a 96 hour median tolerance for snail eggs of 632 mg/L; and a 96 hour median tolerance for Amphipoda of 160 mg/L.

Section 12 – Disposal Considerations

Waste Disposal Method

Waste Treatment: Neutralize and landfill solids in an approved waste facility operated by an authorized contractor in compliance with local regulations.

Package (Pail) Treatment: The empty and clean containers are to be recycled or disposed of in conformity with local regulations.

Section 13 – Shipping/Transport Information

D.O.T.: This product is not regulated as a hazardous material so there are no restrictions.

Section 14 – Other Information

HMIS[®] Rating	Health – 2 (moderate)	Reactivity – 0 (none)
	Harmability – 0 (none)	Lab PPE – goggles, gloves, and lab coat
	Contact – 1 (slight)	

HMIS[®] is a registered trademark of the National Painting and Coating Association.

Individuals receiving this information must exercise their independent judgment in determining its appropriateness for a particular purpose.

RegenOx™

Advanced Chemical Oxidation

Excavation Application

Purpose: Describe the preferred protocol for excavation application of RegenOx.

RegenOx™ is a two-part product. Part-A (the oxidizer complex) and Part-B (the activator complex) each are separately packaged in easy-to-handle pails. Part-A and Part-B can be mixed together without concern of excess heat or gas generation. RegenOx does not require special injection tools or patented injection processes. For source contaminant treatment in the saturated zone, RegenOx is typically pumped into the subsurface using easily-obtainable equipment standard to the remediation contracting and drilling industry. However, when treating source contamination in the vadose zone, RegenOx can be used in conjunction with an excavation removal treatment. RegenOx can be applied into the excavation pit to extend source contamination removal from the saturated zone and laterally from the excavation walls into the vadose zone.

RegenOx application into an excavation pit is typically done by adding RegenOx with no amendments. First, all personnel within the exclusion zone of the excavation application should have proper Personal Protection Equipment (PPE, Figure 1*). They should have PPE to protect eyes, respiratory system and skin. Second, the recommended dose of Part-B Activator Gel should be re-suspended/mixed in the shipping container (Figure 1) and then added to the excavation pit. Care should be taken not to splash the product out of the pit or on personnel. The Part-B should be distributed evenly and mixed into the soil as well as possible. Third, the recommended dose of Part-A Oxidizer powder should be added to the excavation pit. Care should be taken to avoid fugitive dust emissions or depositing on personnel. The Part-A should be distributed evenly and mixed into the soil. To further distribute the RegenOx throughout the treatment area water should be added until standing (saturated). As a final step, clean backfill can be added to the excavation pit.

Figure 1: Proper PPE for Application of RegenOx

Photos from a RegenOx excavation application are shown on the following page. RegenOx was added to the pit by using a front end loader (Figure 2) and the excavation was filled with clean backfill (Figure 3).

*All photos courtesy of LRS of North Carolina

Figure 2: Application of RegenOx with a Front End Loader.

3(a) the open excavation pit, (b) adding RegenOx with the front end loader, (c) backfilling with clean soil, (d) the site after backfilling is complete

REGENESIS RegenOx™ Field Demonstration

In-Situ Chemical Oxidation at a Retail Gas Station

RegenOx incorporates a solid alkaline oxidant built around a sodium percarbonate complex which is activated using a multi-part catalytic formula to maximize in situ performance. The product is delivered as two parts that are combined and injected into the subsurface using common drilling or direct-push equipment. Once in the subsurface, the combined product produces an effective oxidation reaction comparable to that of Fenton's Reagent yet without a violent exothermic hazard. As a result of this reaction RegenOx safely, effectively and rapidly destroys a wide range of contaminants in both soil and groundwater.

SITE SUMMARY

Petroleum hydrocarbons had leaked from a pumping island and three underground storage tanks (USTs) at a gasoline service station in Vermont. The USTs were removed and further investigations revealed high levels of subsurface petroleum hydrocarbon contamination. In 2000 mass removal technology pilot tests were performed at the site. Based on the results, multi phase extraction (MPE) was chosen for full scale application and the system was implemented in 2001. By 2004 the MPE had run its course as the mass removal rates of petroleum-related volatile organic compounds (VOCs) had decreased to asymptotic levels. A new approach utilizing chemical oxidation was sought. In August 2004, RegenOx was pilot tested in a 12-point injection grid around well MW-19. An additional well, MW-21, was installed prior to injection in order to sample the results upgradient of MW-19. A second, planned pilot-injection of RegenOx was applied about 30 days later.

REMIEDIATION APPROACH

- **Remediation Objective:** Reduce concentrations of BTEX and naphthalene within the pilot test area.
- **Application Type:** Pilot Scale Grid Injection
- **Product:** RegenOx
- **Quantity Applied:** Injection 1: 475 lbs RegenOx Oxidant, 200 lbs RegenOx Activator
Injection 2: 725 lbs RegenOx Oxidant, 450 lbs RegenOx Activator
- **Application Rate:** 13 lbs/ft
- **Injection Spacing:** 8 ft on-center

SITE CHARACTERISTICS

General

- **Name:** Quarry Hill Quick Stop
- **Location:** Barre, VT
- **Industry:** Gas Station
- **Contaminants of Concern:** See Table 1

Hydrogeology

- **Treatment Area:** 600 ft²
- **Soil Type:** Fine sand and silt
- **Groundwater Velocity:** 0.3 ft/day
- **Groundwater Flow Direction:** Northeast
- **Depth to Groundwater:** 10 ft

Table 1. Well MW-19 CoCs

Contaminant	Concentration
Benzene	68.6 ug/L
Toluene	56.2 ug/L
Ethylbenzene	227 ug/L
Xylenes	355.3 ug/L
Naphthalene	64.8 ug/L

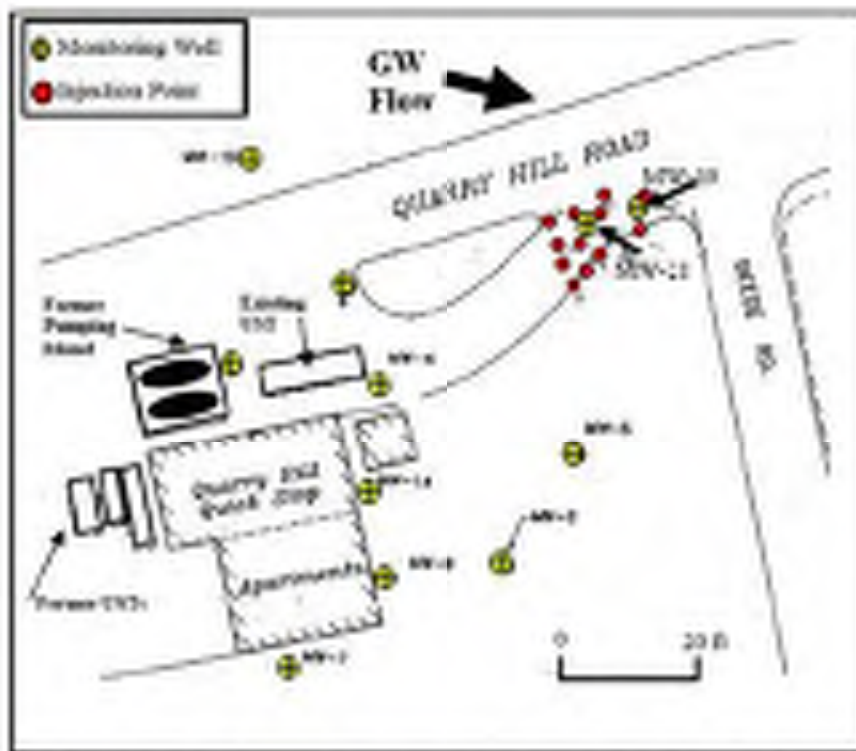

Figure 1. Site Map with RegenOx Injection points around well MW-19 and MW-21

RESULTS

Concentrations vs. Time

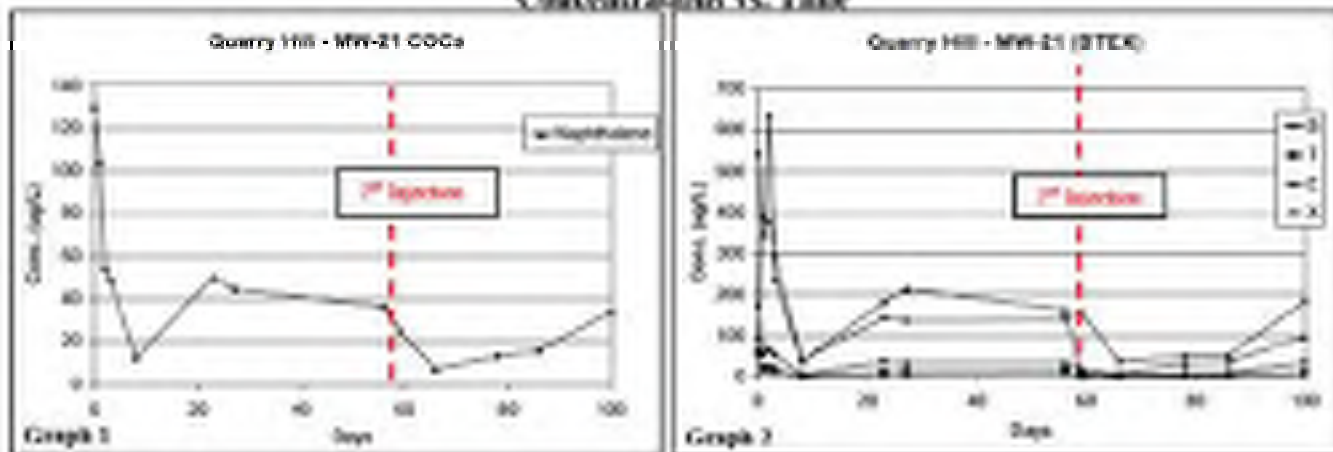

Table 2. Application Results - MW-21 (µg/L)

Contaminant	Baseline	48 Hrs	72 Hrs	1 Week	4 Weeks	8 Weeks	12 Weeks	% Reduction
Benzene	178	66.3	52.6	5.7	31.6	31.7	38.6	80%
Toluene	56.3	21.2	18.2	2	69.7	32.6	31.3	80%
Ethylbenzene	543	636	237	37.6	213	183	97.6	82%
Xylenes	85.3	375	203	38.9	135.7	138.7	133.5	increase
Naphthalene	130	58.4	68.3	12.2	68.5	36	33.7	76%

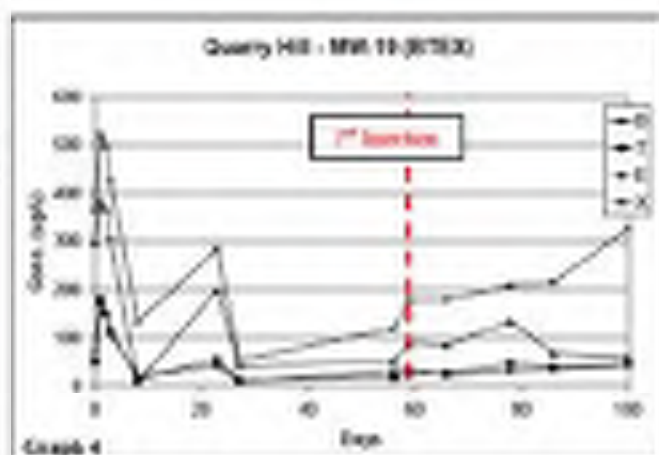

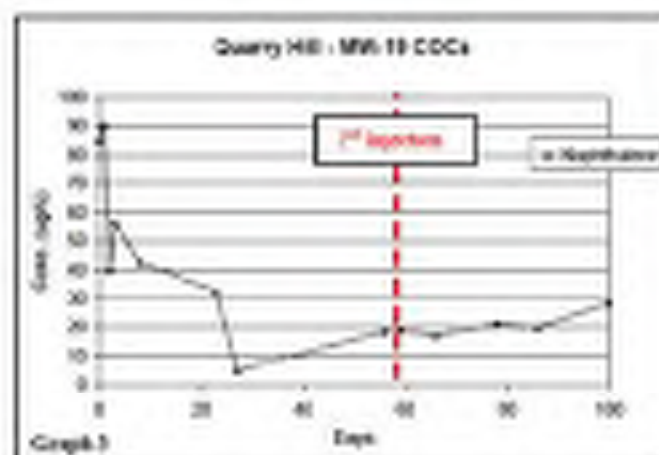

Table 3. Application Results - MW-19 (ug/L)

Contaminant	Baseline	48 Hrs	72 Hrs	1 Week	4 Weeks	8 Weeks	14 Weeks	% Reduction
Benzene	82.6	14.7	100	23.0	9.2	11.7	41.6	38%
Toluene	50.3	15.2	11.7	3.8	12.2	12.3	46.2	28%
Ethylbenzene	25.7	18.8	30.5	6.0	39.5	51.2	50.2	79%
Xylenes	365.1	499.2	426.7	142.1	51.7	109.1	126.2	10%
Naphthalene	14.2	19.6	56.4	42.1	1.2	12.3	22.3	66%

CONCLUSION

The pilot test was designed for multiple injections of RegenOx in order to reduce contaminant mass. Two injections have been conducted thus far. Oxidation of contaminants in the dissolved phase within the injection area occurred immediately (based on MW-21 and after 1 week, results showed 97% removal of benzene, 97% removal of toluene, 94% removal of ethylbenzene and 63% removal of naphthalene). Xylenes seemed to be the BTEX component with the most persistence. As to be expected, gradual rebound followed suit as the RegenOx oxidants were consumed and as soil bound contaminants dissolved. Soil samples will be collected to confirm total mass removal.

REGENESIS

RegenOx Treats Mixed Chlorinated Solvent and Hydrocarbon Plume

REGENOX™ CHEMICAL OXIDATION TREATMENT

RegenOx uses a solid alkaline oxidant containing sodium percarbonate complex which is activated using a multi-part catalytic formula to maximize in site performance. The product is delivered as two parts that are combined and injected into the subsurface using common drilling or direct-push equipment. Once in the subsurface, the combined product produces an effective oxidation reaction comparable to that of Fenton's Reagent yet without a violent exothermic hazard. As a result of this reaction RegenOx safely, effectively and rapidly destroys a wide range of contaminants in both soil and groundwater.

SITE SUMMARY

Groundwater beneath a chemical distribution facility was contaminated with toluene, ethyl benzene, xylenes, vinyl chloride, cis-1,2-dichloroethane, perchloroethylene and methyl isobutyl ketone (MIBK). RegenOx was selected to quickly reduce contaminant concentrations in the mixed chlorinated solvent and hydrocarbon plume. Two RegenOx direct-push applications occurred in August and September of 2006.

REMEDIATION APPROACH

Remediation Objective: Reduce concentrations of toluene, ethyl benzene, xylenes, PCE, VC, cis-DCE, toluene and methyl isobutyl ketone (MIBK)

- **Application Type:** Injection point grid application
- **Product:** RegenOx
- **Quantity Applied:** 1st application: 1800 lbs. RegenOx
2nd application: 1500 lbs. RegenOx
- **Application Rate:** 20-30 lbs./ft.
- **Injection Spacing:** 6 ft. on-center

SITE CHARACTERISTICS

General

- **Name:** Confidential
- **Location:** Alberta
- **Industry:** Chemical Distribution Facility

Hydrogeology

- **Treatment Area:** 2500 ft²
- **Soil Type:** Clay
- **Groundwater Velocity:** ~ 0 ft./day
- **Depth to Groundwater:** 5 ft.

Figure 1. On Site Direct Push Injection

Figure 2. Site Layout Photo

RESULTS

Figure 3. Distribution of RegenOx in heterogeneous subsurface (relative units): 1st injection (left) and 2nd injection (right)

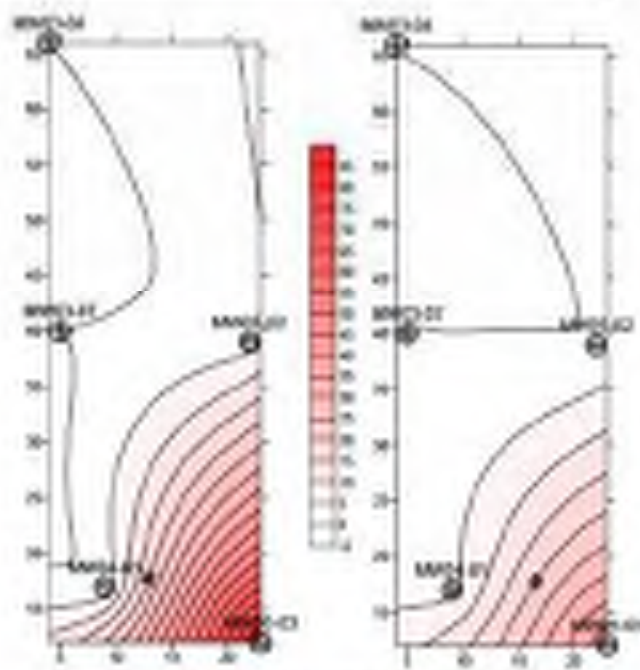

Figure 4. Toluene concentrations (mg/L) pre injection July 2005 (left) and post injection Oct 2005 (right)

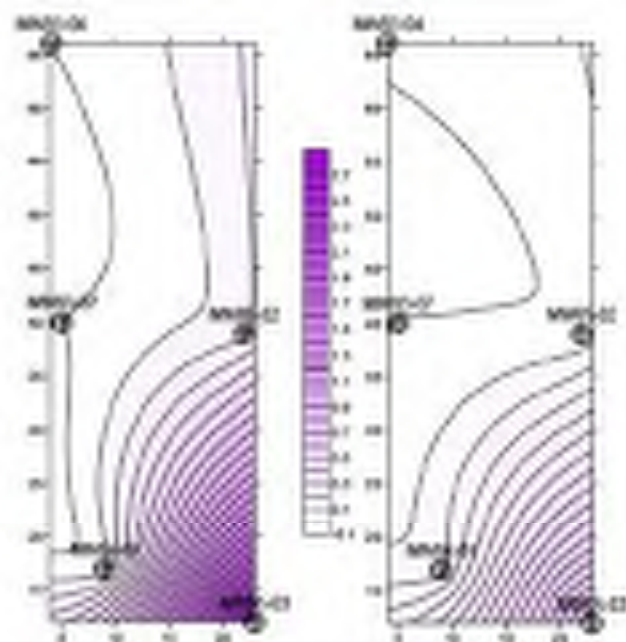

Figure 5. Ethyl benzene concentrations (mg/L) pre-injection July 2005 (left) and post injection Oct 2005 (right)

Figure 6. Vinyl chloride concentrations (mg/L) pre-injection July 2005 (left) and post injection Oct 2005 (right)

Table 2. Contaminant Reduction with RegenOx in MW 05-03

Analyte (mg/L)	Pre-RegenOx	Post-RegenOx	% Reduction
Toluene	87	44	50
Diethyl Benzene	2.7	0.90	66
Xylenes	13	3.5	61
Vinyl chloride	20	1.2	94
Cis 1,2-Dichloroethene	21	5.2	63
Tetrachloroethene	654	113	76
Methyl Isobutyl Ketone	200	53	78

CONCLUSION

Since RegenOx was injected into a clay formation, the application rates varied across the site. Figure 3 shows the RegenOx product distribution based on the injection volumes. Some areas of the formation were able to accept more RegenOx (shown in dark blue) than other areas (shown in white).

Significant contaminant reductions were observed across the site, with vinyl chloride (Figure 6) and MIBK showing the largest percent reductions. In the most contaminated well, MW05-03, contaminant reductions ranged from 24-90% after the first application round. RegenOx application to an expanded treatment area is planned January 2006. Over a short period of 3 months, RegenOx effectively degraded a mixed phase containing chlorinated solvents, BTEX contaminants and MIBK.

RegenOx Treats High TPH Concentrations

REGENOX CHEMICAL TREATMENT

RegenOx uses a solid alkaline oxidant containing sodium percarbonate complex which is activated using a multi-part catalytic formula to maximize in situ performance. The product is delivered as two parts that are combined and injected into the subsurface using common drilling or direct-push equipment. Once in the subsurface, the combined product produces an effective oxidation reaction comparable to that of Fenton's Reagent yet without a violent exothermic hazard. As a result of this reaction RegenOx safely, effectively and rapidly destroys a wide range of contaminants in both soil and groundwater.

SITE SUMMARY

TPH contamination in soil occurred as a result of a heating oil spill from a fuel oil boiler at a site in the U.K. Soil concentrations of total petroleum hydrocarbons (TPH) had reached more than 27,000 mg/kg beneath the building onsite. Remediation was required; however, excavation could not be done due to the nature of the building structure. RegenOx was applied to the contaminated soil in August 2005 by using hand-dug trenches and a follow-up round of sampling was completed 4 weeks after the RegenOx application.

REMEDIATION APPROACH

Remediation Objective: Reduce concentrations of TPH within the source area.

- **Application Type:** Trench application
- **Product:** RegenOx
- **Quantity Applied:** 2100 lbs RegenOx Oxidant
2100 lbs RegenOx Activator
- **Product Cost:** \$10,500

Table 1. Highest TPH Concentration Onsite

Soil Sample	TPH Concentration
3005	27,300 mg/kg
3001	14,700 mg/kg
3002	6,930 mg/kg

Figure 5. RegenerOx Part A (oxidant)

Figure 6. RegenerOx Part B (activator)

RESULTS

Table 2. TPH Reduction Using RegenOx

Sample	Pre- RegenOx (mg/kg)	Post- RegenOx (mg/kg)	Reduction
B001	5,376	568	89%
B002	176	161	9%
B004	833	474	43%
B005	405	177	57%
B006	159	175	-10%
B007	903	596	34%
B009	319	178	44%
B011	14,700	570	96%
B006	27,300	981	96%
B017	362	284	22%
B019	536	330	38%
B021	6,950	560	92%
Average	4,824	405	92%

CONCLUSION

RegenOx application was targeted to areas of highest visual contamination where the greatest contaminant reduction was necessary in advance of a vapor barrier installation. Reductions were seen in almost all soil samples with the exception of B006, a sample that previously contained low concentrations and where RegenOx application was minimal. Among the high concentration samples where RegenOx application was higher, a reduction of at least 95% was observed within one month of the RegenOx application. Overall, an average TPH reduction of 92% was measured. Upon entering the building for the post application sampling, field personnel noted that for the first time there was no strong smell of fuel oil. Following this treatment, the regulators have required no further remedial action. RegenOx proved to be an inexpensive, effective remediation strategy and required no special equipment.

Re: 4650 Broadway, New York, NY

Dear Sir or Madam:

CNS Management Corporation (CNS) was retained by Acadia P/A Sherman Avenue, LLC to collect groundwater samples for the purposes of obtaining approval from the New York City Department of Environmental Protection (NYCDEP) for groundwater discharge to a sanitary or combined sewer at 4650 Broadway located in New York, NY; referred to hereafter as the subject site. See Figure I: Site Location Map.

On Tuesday May 12, 2009, CNS collected groundwater samples from two (2) on-site observation wells labeled OW-A and OW-B installed on 5/5/2009 (See Figure II: Observation Well Locations). Prior to collecting the groundwater samples, CNS measured the depth to groundwater from the top of the well casings utilizing an electronic Keck Water Level Meter. The groundwater samples were placed in laboratory supplied glassware, packed in an ice-filled cooler accompanied by chain-of-custody documentation and picked up onsite by Phoenix Environmental Laboratories, Inc. and transported to their facility located at 587 East Middle Turnpike, Manchester, CT 06640 for analysis in accordance with 40 CFR part 136. Note: CNS collected additional sample volumes on 5/14/09 at approximately 13:00 and on 5/19/09 at approximately 14:00, to ensure that the laboratory had adequate material for the analysis.

Prior to sampling, the wells were purged of 3 to 5 well volumes utilizing a low flow submersible pump with disposable tubing. In addition, after the final well purge within each observation well, measurements for temperature, conductivity and pH were collected, utilizing a YSI 556 Multi Probe System within non-chemically analyzed clean sample jars. See table below for Groundwater Measurements.

Parameter	Locations	
	OW-A	OW-B
Monitoring Well #		
Depth to Groundwater	0.7'	0.2'
Time Collected	10:30	10:45
Temperature (F)	66.3	64.04
Conductivity (µmhos)	14.01	12.97
pH	6.92	6.42

Attached to this letter are drawings and laboratory reports with data deliverables. If you have any questions or require additional information, please call me at (516) 932-3228.

Sincerely,

Charles Powers
President

CNS ACADIA

Methodology Summary

Wet Chemistry Parameters

Standard Methods for the Examination of Waste and Wastewater, 18th edition Method C60D (5210B) Chloride (4500-CL-E) Hex Chromium (2500CRD) pH (4500-H B).

Oil & Grease (Non-polar Material)

Methods for Chemical Analyses of Water and Wastes, EPA, Environmental Monitoring Systems Laboratory Cincinnati (EMSL-CL), EPA-600/4-79-020 Method 1664A Modified.

Nitrogen

Methods for Chemical Analyses of Water and Wastes, EPA, Environmental Monitoring Systems Laboratory Cincinnati (EMSL-CL), EPA-600/4-79-020, method 353.2 (Nitrate and Nitrite) and method 351.1 (TKN).

Naphthalene, Phenol, Trichlorobenzene

Environmental Protection Agency, EPA-600/4-79-020, Revised March 1983 (Methods 825) as printed in 40CFR part 136.

Mercury

Methods for Chemical Analyses of Water and Wastes, EPA, Environmental Monitoring Systems Laboratory Cincinnati (EMSL-CL), EPA-600/4-79-020, method 245.1
USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, 7470.

ICP Metals

USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods 3rd Ed. Update IV, Method 6010C.
Environmental Protection Agency, EPA-600/4-79-020, method 200.7

SDG I.D.: GAR60508

CNS ACADIA

SDG Comments

All analyses were performed in accordance with 40CFR part 136.

The regulatory hold time for pH is immediate. The pH was performed in the laboratory and may be considered outside of hold-time.

Nitrate is analyzed by calculation of combined nitrate-nitrite 353.2 minus nitrite 353.2 as defined in 40CFR part 136 (note 38).

Total Nitrogen is the sum of Nitrate, Nitrite, and TKN.

No other observations are noted.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the systems, or those persons directly responsible for gathering the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Comments:

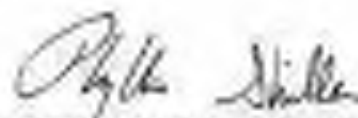

Spillability is based solely on the results of the closed-loop endpoint analysis performed above.
The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold time.

* Poor surrogate recovery was observed. Insufficient sample for re-analysis.

Fluoride, TSS and TDS could not be analyzed due to limited sample.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

Handwritten notes in the left margin, including "100000" and "1000000", with arrows pointing to the table rows.

- All handling and preparation of collected samples and laboratory analysis of samples shall be performed in accordance with 40 C.F.R. pt. 136. If 40 C.F.R. pt. 136 does not cover the pollutant in question, the handling, preservation and analysis shall be performed in accordance with the latest edition of "Standard Methods for the Examination of Water and Wastewater." All analyses shall be performed using a detector level less than the lowest applicable regulatory discharge limit. If a parameter does not have a limit, then the detection level is defined as the least of the Practical Quantitation Limits identified in NYSDDEC's Analytical Detection Method Description Subcategory for Selected Environmental Parameters, December, 1999.
- Analysis for non-polar metals must be done by EPA method 8000 Rev. A. Non-Polar Metals shall mean that portion of the oil and grease that is not oil or grease, a portion containing hydrocarbons, or any other substance which the EPA shall prescribe, by or under an exception.
- Analysis for PCBs is required if both conditions listed below are met:
 - a) proposed discharge > 75,000 gpd
 - b) duration of discharge > 10 days

Analysis for PCBs must be done by EPA method 8021 with HPL-MS not PCBs (total) is the sum of PCB-1202 (Arochlor 1242), PCB-1204 (Arochlor 1254), PCB-1205 (Arochlor 1221), PCB-1206 (Arochlor 1232), PCB-1209 (Arochlor 1248), PCB-1260 (Arochlor 1260) and PCB-1016 (Arochlor 1016).
- For discharge > 10,000 gpd the TSS shall be 350 mg/L. For discharge < 10,000 gpd, the limit is determined on a case by case basis.
- Analysis for Compositeous Dichloride Oxygen Demand (COCOD), Chloride, Total Solids and Total Nitrogen are required if proposed discharge > 10,000 gpd. Total Nitrogen = Total Kjeldahl Nitrogen (TKN) + Nitrate (NO₃) + Nitrite (NO₂).

Re: Groundwater Sampling - December 2009
Site: 4650 Broadway, New York, NY 10040
NYSDEC Spill # 09-02240
CNS Job #: 820682

Dear Mr. Piper,

On Tuesday, December 29, 2009, CNS Management Corp. (CNS) collected groundwater samples from four (4) existing monitoring wells located at 4650 Broadway in New York, New York, referred to hereafter as the subject site. See Figure I: Site Location Map.

Background

Based on findings of a subsurface investigation, gasoline contamination was identified within the groundwater at the subject site. Based on these findings CNS completed and executed a NYSDEC approved Remedial Action Plan dated June 12, 2009 (NYSDEC RAP Approval Email dated July 10, 2009), bound under a separate cover, which consisted of the removal of Underground Storage Tanks (UST) and associated impacted soils, if applicable; and the installation of monitoring wells and utilizing RegenOx™ chemical oxidizer injections, to effectively remediate the groundwater. Note: prior to the RegenOx™ application, CNS collected a round of groundwater samples from each monitoring well to establish a site baseline.

Upon completion of remediation, CNS submitted a Remediation Report (Remediation Report dated October 22, 2009 bound under a separate cover) and was subsequently directed by the NYSDEC to collect quarterly groundwater samples.

Field Activities

Groundwater samples were collected from the four (4) existing on-site monitoring wells labeled MW-1 through MW-4 (See Figure II: Monitoring Well Locations). Prior to collecting the groundwater samples, CNS measured the depth to groundwater from the top of the well casings utilizing an electronic K&E Water Level Meter.

Prior to sampling, the wells were purged of 3 to 5 well volumes utilizing a low flow submersible pump with disposable tubing. In addition, after the final well purge within each monitoring well, measurements for temperature, conductivity, pH, dissolved oxygen and oxygen-reduction potential (ORP) were collected, utilizing a YSI 556 Multi Probe System within non-chemically analyzed clean sample jars. See Table I for Groundwater Measurements.

The collected groundwater samples were collected in accordance with USEPA "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (SW-846) and analyzed for VOCs and SVOCs in accordance with NYSDEC State Protocols under EPA analytical Methods 8260 and 8270. The groundwater samples were placed in laboratory supplied glassware, packed in an ice-filled cooler accompanied by chain-of-custody documentation and picked up onsite by Phoenix Environmental Laboratories, Inc. and transported to their facility located at 587 East Middle Turnpike, Manchester, CT 06040. See Appendix A for Laboratory Analytical Data Sheets.

The collected groundwater samples were compared against the NYSDEC's Technical & Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Groundwater Effluent Limitations (NYSDEC Groundwater Standards). A summary of the analytical results in the table overleaf.

Groundwater Measurement Parameters

As indicated in Table I below, temperature levels ranged between 44.21°F through 56.38°F with an average temperature of 51.45°F. pH levels ranged between 6.75 through 7.55. Dissolved Oxygen levels ranged between 8.04 through 13.3 mg/l. Qualitative ORP levels ranged from -84.0 through -58.4.

Table I: Groundwater Measurements

Monitoring Well #	MW-1		MW-2		MW-3		MW-4	
	4/12/09	10/21/09	4/12/09	10/21/09	4/12/09	4/21/09	4/12/09	10/21/09
Temperature (°F)	47.27	51.27	46.71	47.27	49.07	49.07	49.07	49.07
pH	6.75	6.95	6.78	7.25	6.92	6.78	6.98	7.18
Dissolved Oxygen (mg/l)	12.30	11.27	11.24	10.80	10.17	12.10	10.80	11.00
ORP (mV)	117	70.1	128	111	126	107	117	128
pH	7.10	7.05	7.07	7.17	7.00	7.00	7.11	7.15
ORP	-67.7	-44.1	-63.3	-40.3	-58.3	-63.3	-63.3	-38.4

Groundwater Analytical Result Interpretation

The subject site's baseline groundwater sampling event occurred on 5/12/2009 prior to the RegenON™ application. Current analytical results compared to the NYSDEC Groundwater Standards are summarized below and shown within Table II on the following pages.

Monitoring well MW-1 remains within the same general contaminant levels when compared against the September 2009 post injection sampling event, where multiple VOC constituents and SVOC Naphthalene remain above the NYSDEC Groundwater Standards.

Monitoring well MW-2 has been drastically reduced, where all VOC and SVOC constituents were reported at non-detectable levels.

Monitoring well MW-3 has also demonstrated a significant decrease in VOC contamination; however levels continue to remain above the NYSDEC Groundwater Standards. SVOC constituents were reported at non-detectable levels.

Monitoring well MW-4 was reported with all VOC and SVOC constituents at non-detectable levels or, at levels below the NYSDEC Groundwater Standards.

Table II: Groundwater Results Summary

Analyte	Contaminant	MW-1			NYSDEC Risk or Standards (DRI)
		Sample	Post-Incident #1

Notes: M1000 TOGS Standards - New York State Department of Environmental Conservation (NYSDEC) Class 1-11 Class SW Groundwater Remediation
 ND - None Detected above Laboratory's Minimum Detectable Limit as Method of Analysis and Instrumentation
 Concentrations exceeding the M1000 Groundwater Standards are highlighted in red.

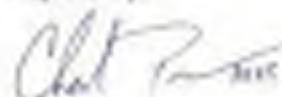

Conclusions

Gasoline related contamination remains present at the subject site from the past underground storage tanks as observed within the past subsurface investigation and groundwater sampling completed by CNS. Analytical results did not identify contaminants within monitoring wells MW-2 and MW-4. Contaminants were identified within monitoring wells MW-1 and MW-3, with the highest amount of contaminants within monitoring well MW-1, respectively.

As indicated in Table 1 the groundwater measurement parameters of temperature, pH, dissolved oxygen and oxygen-reduction potential (ORP) indicate favorable ranges for active oxidation and microorganisms, however these levels need to be substantiated via further monitoring. The next groundwater sampling event is scheduled for March of 2010.

Enclosed within this report are site drawings and laboratory analytical results. If you have any questions or require any additional information please call me at (516) 932-3228.

Attn: Mr. Elias Slaiby

Re: Supplemental Geotechnical Investigation Report
Proposed Six (6) Story Building
4650 Broadway
New York, NY
GTC Job No.: ACD809

Dear Mr. Slaiby:

Pursuant to your request, Geo Tech Consultants LLC (GTC) has completed a limited supplemental geotechnical investigation for the above referenced project. The purpose of this investigation was to obtain additional subsurface data from within a strip area alongside the existing adjacent buildings for piling design.

The work was performed in accordance with our proposal dated April 28, 2009 and your subsequent written authorization.

The scope of our service was described in our proposal and included:

- Drilling and full-time inspection of three (3) test borings;
- Performance of engineering evaluation to determine the stratigraphy and physical characteristics of the subsoils, and to develop recommendations for the design and installation of piling systems for support of the building portion in question;
- Preparation of a written report summarizing all findings, conclusions, and recommendations.

1 PROJECT AND SITE DESCRIPTION

The project site is located at 4650 Broadway at the intersection of Broadway and Sherman Avenue in New York, New York. A two (2)-story, concrete and masonry structure occupies the entire footprint of the site. The existing building includes a basement parking area, as well as parking and office areas on both the ground floor and second floor.

The proposed construction consists of a new six (6) story building with basement. It is our understanding that the proposed building has been designed to support on spread footings in most area except for the areas alongside the existing adjacent buildings where piling support is expected. The pile-supported area is the focus of this investigation.

2 FIELD EXPLORATION

The subsurface conditions of the project site had previously been investigated by Soil Mechanics Drilling Corp (SMDC), who performed a total of twenty-seven borings. A preliminary review of the boring logs by GTC suggested that none of the 27 borings performed was advanced into bedrock to provide parameters for the design of drilled piles or caissons.

To provide rock parameters for the piling design, GTC was commissioned by Acadia Realty to install three (3) supplemental borings within the perceived pile-supported area. These borings labeled as GTC-1, GTC2, and GTC3 were performed by Craig Test Boring of Mays Landing, New Jersey between May 11, 2009 and May 18, 2009 and under the supervision of Geo Tech Consultants (GTC) professional engineering staff. The as-drilled boring locations are shown on drawing BLP-1, which is attached at the end of this report.

Each of these three (3) supplemental borings was advanced to a depth of 5' below the top of bedrock, which was encountered at depths ranging from 47' to 57'. Soils encountered were sampled continuously to a depth of 12' and at five (5) foot intervals thereafter. Each soil sample was extracted using a Standard Split-Spoon sampler by performing a Standard Penetration Test (SPT) in accordance with ASTM D1586. Where encountered, the bedrock was cored with one 5' run using NX double core barrels.

During the drilling operations, extracted soil samples and rock cores were visually examined and classified by our field engineer. The soil samples were then placed in sealed glass jars and rock cores in wooden boxes, both of which were later returned to our office for further review.

3 SUBSURFACE CONDITIONS

Detailed description of the soils encountered in the borings was documented in the boring logs, which are presented in Appendix A. The following provide a general description of the soil profile inferred from the test borings. While the borings may indicate that the subsurface conditions appear to be relatively uniform across the site, it should be recognized that the number of borings was small compared to the size of the site, and that the existence of anomalies cannot be precluded.

3.1 Soil Profile

All three supplemental borings were drilled from and through the existing basement slab and advanced into bedrock. Bedrock was encountered in borings GTC-1, GTC-2, and GTC-3 at respective depth of 47', 57', and 49' below existing basement slab. The bedrock was cored at each boring location with a 5' run using an NX Double-Core Barrel. Core recovery was good to excellent (80%-100%) and rock quality was fair to good with R.Q.D. (Rock Designation Quality) ranging from 58%-86%. Examination of the retrieved rock cores suggests that the bedrock is of the Manhattan Schist formation. Based on these coring results, the bedrock may be classified as NYC 3-65 or 2-65 class (or Class 1c or 1b of the 2008 Code).

The soil overburden above the bedrock was found to be anything but uniform. In general, approximately 2' - 4' of urban fill was encountered at the top, which was followed by alternate layers of silt/clay and sands with no specific pattern. The fill materials consisted of coarse, medium, and fine sands with trace amounts of brick, concrete, gravel, silt, and clay. The fill is classified as NYC 11-65 (Class 7 of 2008 Code) and is considered unsuitable bearing material.

Below the fill, alternate layers of silt and sands were found to extend to the top of the bedrock with no specific pattern. The silt soils were encountered in boring GTC-1 between 4' and 35' of depth, in GTC-2 between 25' and 45' of depth, and in GTC-3 between 25' and 49'. Based on the SPT values, the silt soils were found to register consistency ranging from soft to medium stiff.

The sand strata were encountered between 35' and 47' of depth in boring GTC-1, from 2' to 25' and from 45' to 57' in boring GTC-2, and from 2' to 25' in boring GTC-3. The sands are mostly NYC 7-65 class with variation of 8-65 class at location. Based on the SPT values, the sand soils were found to be generally loose in the strata above the silt layers and medium dense to very dense in the strata below the silt layers.

Based on our review of the retrieved soil samples, it appears that the natural soil overburden encountered above the Manhattan Schist bedrock is the weathered products of the more erodible Inwood Marble Formation that once overlies the Manhattan Schist in this area.

3.2 Groundwater

Groundwater was encountered in all three supplemental borings at a depth of about 6' below existing basement slab. It should be pointed out that groundwater table is known to fluctuate with seasonal, tidal and climatic conditions.

4 DISCUSSION AND RECOMMENDATIONS

The borings indicate a general profile of 2' to 4' of urban fill, followed by alternate layers of natural silt and sands to the top of the bedrock, which was encountered at depths of 47' to 57' below grade.

4.1 Foundation Support and Design Criteria

In light of the non-uniform conditions of the soil profile established above, it is our opinion that friction piles would not be feasible. The site conditions favor the use of end-bearing piles whether it is driven or drilled.

Driven piles such as open-ended pipe piles extending to bear on bedrock may be considered only if pile driving-induced vibration is not a concern or it is known that the adjacent buildings are supported on piles.

If pile driving is considered impermissible due to concern over vibration and/or noise, it would be necessary to use drilled piles such as mini-caissons that extend into bedrock.

4.1.1 Drilled Piles – Mini-caissons

Mini-caissons are small diameter piles, typically ranging from 8” to 12” that are installed by drilling and socketing into bedrock. Mini-caissons derive its capacity from bonding between its grout and the surrounding bedrock.

Based on the boring data obtained during this investigation, we believe that micropiles of 10” diameter (nominal OD) can derive a bearing capacity of 100 tons. For designing purpose, one may use an average allowable bonding strength of 100 psi for the bonding between grout and the bedrock. The grout should be neat cement grout having a minimum compressive strength of 4000 psi. The rebar to be used for the pile core should be of grade 75 or higher. Steel casing of A-36 should extend to the top of the bedrock.

Micropiles shall be subject to detailed design by the contractor’s own engineer. The designer shall prepare shop drawings with calculations and submit same to project engineer for review and approval prior to installation.

4.2 Foundation Settlements

From geotechnical standpoint, building portions that are to be supported on mini-caissons will yield little to no settlements. However, the portions of the building that are to be supported on spread footings will inevitably undergo some long-term settlements. Thus differential settlements between the two different foundation-supported sections would result. Based on the current footing design pressure of 2 tsf, we estimate such settlements would be on the order of one-half of one inch. The effect of such differential settlements will need to be evaluated by the structural engineer.

4.3 Seismic Design Considerations

The site is located within the Seismic Zone having a seismic zone factor of 0.15 as defined by the NYC Building Code and should be designed accordingly.

Based on the soil profile established from the borings, we suggest that the site be classified as S₂ Type soil, having a site coefficient of 1.2. Refer to 1968 NYC Building Code for additional seismic-related criteria for foundation design.

If the 2008 new NYC Building Code were to be used for seismic design, a site class D may be considered.

4.4 Basement Wall and Slab

4.4.1 Design Groundwater Level

Groundwater table was encountered in all three supplemental borings at a depth of 6' below existing basement slab. To account for seasonal variation, we suggest that the design groundwater table be assumed at a depth not shallower than 2 ft below existing basement slab.

4.4.2 Lateral Earth Pressures

The following recommendations regarding lateral pressures are applicable to new foundation walls.

Permanent basement walls should be designed to withstand long-term, at rest equivalent fluid pressures of 60 pound per cubic foot (pcf) above design groundwater level and 90 pcf below groundwater level.

Temporary walls, such as excavation shoring, if required, should be designed to withstand equivalent fluid pressure of 40 pcf above groundwater level and 80 pcf below groundwater level.

4.4.3 Basement slabs

Based on the soil profile established above, it is our opinion that the basement slab within the proposed pile-supported zone may be designed as slab-on-grade provided the slab is supported on at least two feet of new controlled compacted fill. Natural ¾" crushed stone may be used as control fill.

It is imperative that the slab subgrade be subject to proofrolling to an unyielding consistency prior to receiving control fill. Proper densification of the existing in-situ soil is key to minimizing potential settlements on the proposed basement slabs. Any loose or soft areas detected during the proofrolling should be removed and replaced with new controlled compacted fill as directed by the inspecting soil engineer. Control fill shall meet the grading requirements as stipulated in the NYC Building Code. The fill should be placed in maximum 12-inch loose lifts with each lift being compacted to at least 95% of its maximum dry density as determined in accordance with ASTM D1557.

Based on our review of boring logs prepared by SMDC, it is our opinion that the basement slab outside the pile-supported zone can be designed as a slab-on-grade provided it bears on at least one foot of controlled compacted fill.

We further recommend that the entire basement slab be supported on at least 6 inches of $\frac{3}{4}$ inch crushed stone over controlled compacted fill or competent natural soils. The floor slabs supported on qualified fill materials may be designed using a modulus subgrade reaction of 75 pci (pounds per square inch per inch). Saw cuts and/or control joints should be provided in the concrete slab construction to control shrinkage.

4.4.4 Foundation Drainage and Under-Slab drainage

Perimeter foundation drainage system is recommended for installation around the new basement wall, if any, to ensure free hydrostatic pressure condition behind the wall. The foundation drainage system may consist of drainage panel and/or 12" of free-draining backfill against the entire foundation wall. The foundation drainage system shall facilitate the percolation of infiltrated surface water into the underlying groundwater system.

Assuming the new basement slabs will be established at the same elevation as the existing basement, which is 6' above the prevailing groundwater table, under-slab drainage system can be optional.

4.5 Waterproofing

Considering the fluctuation of groundwater table, the design groundwater table as recommended above, and soils capillary action, we suggest the following guidelines regarding waterproofing.

For foundation wall, we suggest waterproofing be provided up to the mid-height of the wall. The upper-half of the wall can be damproofed as minimum.

For basement slabs and any other below-grade structures to be established below design groundwater table, we recommend that waterproofing be provided. For structures to be established above this elevation, waterproofing can be optional. However, if the basement slab is to be protected at all times against the potential groundwater rise due to global warming, it may be prudent to provide waterproofing for the entire basement slab.

4.6 Dewatering

Dewatering shall be expected, and implemented during foundation and site preparation. Previous boring work suggested that some of the suitable bearing soil for spread footings are found below groundwater, thus extensive dewatering effort may be required, in which case, well-point method may prove to be more effective than the traditional sump pumping

technique. We suggest a dewatering specialist be consulted prior to commencing any dewater activity.

5 CONSTRUCTION MONITORING

5.1 Protection of Adjacent Structures and Sidewalk

Depending upon the proximity of the proposed new foundation to the adjacent structures and sidewalk, shoring, bracing, and underpinning of the adjacent structures and sidewalks may be required, which, if required, should be designed by a professional structural engineer engaged by the contractor. The design drawings should be submitted to the project engineer for review and approval prior to installation. The installation work shall be subject to control inspection by a qualified professional engineer registered in the State of New York as per the NYC Building Code.

5.2 Pre-construction Survey

It is strongly recommended that a pre-construction survey be conducted to document the existing conditions of the adjacent buildings, and sidewalks prior to commencement of any construction activities including underpinning. The conditions of the adjacent structures and sidewalk should be monitored periodically during the course of the project.

5.2 Backfilling and Filling

Backfilling against the basement walls should not commence until the wall concrete has gained sufficient strength and/or the wall is properly braced or shored. The backfill material should consist of relatively free-draining soil containing less than 10% fines (minus No 200-sieve size). The backfill should be placed in loose horizontal lifts with each lift not exceeding 12 inches in thickness. Each lift should be compacted to at least 92% of the maximum dry density of the fill as determined in accordance with ASTM D1557.

Backfilling against the footings should utilize qualified fill materials meeting the grading requirements for control fill as per NYC Building Code. Control fill should be placed in 12-inch loose lifts and each lift should be compacted to at least 95% of its maximum dry density as determined in accordance with ASTM D1557.

6 LIMITATIONS

The conclusions and recommendations contained in this report are based on the subsurface data obtained during this investigation and on the details stated in this report. Should conditions be encountered which differ specifically from those stated in this report, we should be notified immediately so that our recommendations may be reviewed and/or revised, if necessary.

7 CONSTRUCTION CONSULTATION AND INSPECTION

Due to the nature of the soils and subsurface conditions at this site and the recommendations set forth herein, consultation and inspection services by a qualified soil engineer are recommended for the following:

1. Preparation of the site including all clearing, stripping of undesirable material, and initial proofrolling and compaction of the in-situ soils.
2. Placement of all controlled backfill and/or fill, if any.
3. Footing subgrade control inspection.
4. Inspection of pile installation.

We trust the above information will allow you to proceed with the design and construction of piling system for support of the proposed building.

We thank you for the opportunity of providing this service to you. Should you have any questions regarding this report, or if we can be of further assistance, please do not hesitate to contact us.

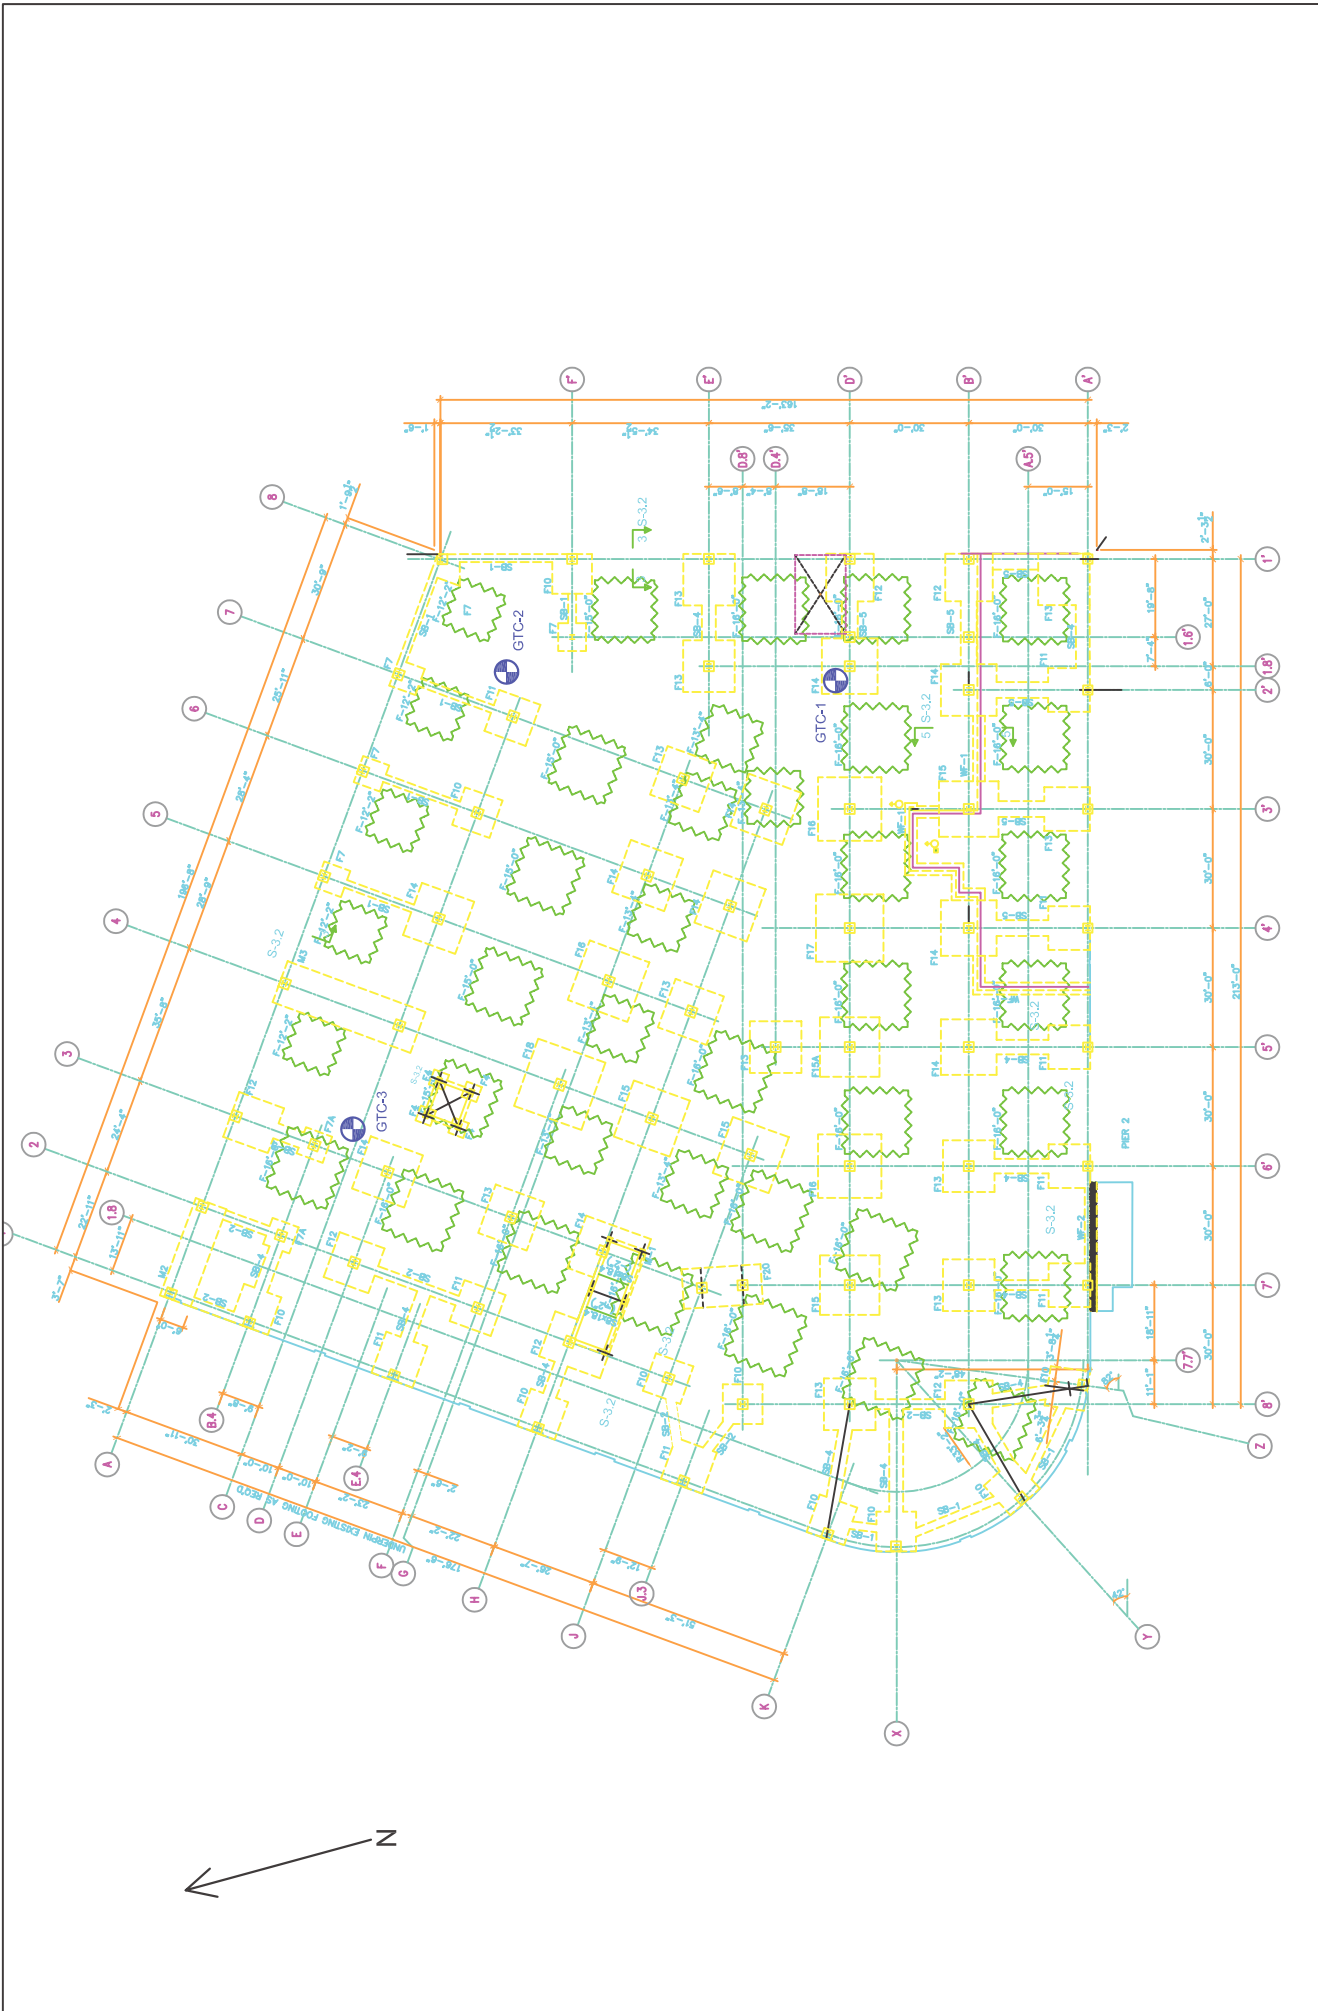

Respectfully Submitted
Geo Tech Consultants LLC

Steve J. J. Lin, P.E.

1.0 Introduction

This Remediation Report was generated by CNS Management Corporation (CNS) for the Acadia P/A Sherman Avenue, LLC property located at 4650 Broadway in New York, New York; referred to hereafter as the subject site. See Figure 1: Site Location Map.

As per the NYSDEC approved Remedial Action Plan dated June 12, 2009 compiled by CNS (bound under separate cover), the work required and approved consisted of the removal of three underground storage tanks (UST) and utilizing chemical oxidizer injections to effectively remediate the groundwater.

2.0 Site Characterization

CNS Management Corp. (CNS) was retained by Acadia P/A Sherman Avenue, LLC to complete the removal of three-Underground Storage Tanks (UST's) at the subject site, which was identified on historical Sanborn Fire Insurance Maps within the southwestern portion of the basement. CNS subsequently exposed the UST's via excavation and advanced test pits and groundwater monitoring wells to delineate the impacted area.

The subject site is 10-feet above sea level and based upon site observations the topography is gently sloping from the West towards the East. Groundwater flow is assumed to follow the topography of the subject site towards the East. A large rocky outcrop was observed in Fort Tyron Park located adjacent to the subject site to the West, also supporting regional groundwater flow towards the East.

On Monday March 30 through Wednesday April 1 of 2009, CNS exposed the identified gasoline UST's and advanced a total of eleven test pits throughout the eastern and southern portions of the subject site in order to delineate the contamination plume. During the advancement of test pits, the soil strata consisted of concrete atop of RCA fill at shallow depths and fine to coarse sandy loam to the average depth of 10' below ground surface (bgs) and clay at the depths of 11' to 12' bgs. Saturated soil or groundwater was encountered within the borings at depths of 5' to 10 bgs.

A total of eighteen soil samples were collected and analyzed via 8260 and 8270 for Volatile Organic Compounds (VOC's) and Semi-Volatile Organic Compounds (SVOC's) utilizing STARS protocols, with results subsequently identifying VOC's consisting of Benzene and Nylene related constituents above the NYSDEC RSCO's within five of the eleven test pits. In addition to the soil collected soil samples, CNS collected additional waste characterization samples for disposal purposes. Analytical results identified the soils as non-hazardous petroleum material that can be disposed at a Class B recycling facility.

From Tuesday May 5th through Thursday May 7th of 2009, CNS installed four groundwater-monitoring wells identified as MW-1 through MW-4, constructed of schedule 40 PVC tubing with a six-foot screen to accommodate the identified shallow level groundwater aquifer at the depth of 3 through 9 feet bgs. Permeo inert material was poured beneath and around the well screen then sealed with Bentonite to grade.

On May 12, 2009 CNS conducted a baseline groundwater sampling event from the installed wells and collected four (4) groundwater samples which were analyzed via 8260 and 8270 for VOC's and SVOC's utilizing STARS protocols. Analytical results identified Benzene, Toluene and Nylene related constituents above the NYSDEC Groundwater Standards within all the sampled wells.

Based upon these findings, it is CNS's opinion that proper phase definition was completed. Observations of relevance made during the investigation consisted of gasoline odors within the sandy loam unstratified zone (3'-7' bgs) soil strata; however analytical results did not identify contaminants above the NYSDEC RSCU's, with exception to the immediate area around the identified UST's. Groundwater is identified at the depths of 4-5' bgs and no gasoline product or sheens were identified.

In order to effectively remediate the site, CNS developed a Remedial Action Plan (RAP) dated June 12, 2009 and bound under separate cover, to remediate the identified gasoline-contaminated soil and groundwater through UST removal, excavation and/or non-intensive oxidation chemical methods, in order to properly and effectively remediate the groundwaters and ascertain a "No Further Action" status by the NYSDEC. See Appendix A: RAP Approval via Email dated July 10, 2009.

3.0 Underground Storage Tank Removal

Mr. Charles Powers of CNS oversaw the removal of one (1) 5,000 gallon fuel oil AST and three (3) 55-gallon gasoline UST's by PAL Environmental Safety Corp. (PAL) from August 5th, 2009 through August 16th, 2009. The steel UST's were vaulted in concrete and located within the southeastern portion of the basement. It needs to be noted that limited access to the UST areas was provided due to a low basement ceiling height of eight-foot. UST Closure activities consisted of the removal of all product lines, associated liquid product/sludge and the excavation of the immediate associated soils in accordance with the following:

1. United States Environmental Protection Authority (USEPA) *Technical Standards and Corrective Action Requirements for the Owners and Operators of Underground Storage Tanks* (CTR Title #0, Part 280)
2. NYSDEC *Handling and Storage of Petroleum* (6 NYCRR Part 613)
3. NYSDEC *TSCH Memo 83 Permanent Closure of Petroleum Storage Tanks guidance*
4. NYSDEC *Spill Technology and Remediation Series (STAR5) #1 Petroleum Contaminated Soil Guidance Policy*
5. NYSDEC DER-10 *Technical Guidelines for Site Investigation and Remediation*
6. NYSDEC *Chapter IV Quality Services Part 375-6: Remedial Program Soil Cleanup Objectives*

On August 5th, 2009, PAL exposed the UST's via excavation at a depth of one-foot below grade surface (bgs) utilizing manual methods. Once the UST's were exposed, the contents were pumped out by PAL, on August 6, 2009, prior to their removal and clean out, where a total of 1,610 gallons of liquid product waste was removed via waste disposal vacuum truck, and disposed of at Clean Waters of New York located at 3245 Richmond Terrace in Staten Island, NY. See Appendix E: Liquid Product Manifest. CNS oversaw the cutting and closing of the UST performed by PAL. All remaining liquid product and sludge were cleaned from the inside of the UST was contained in three 55-gallon drums and sealed. Upon the completion of the tank cleanings, the UST area was further excavated and the tanks were removed. Upon removal of the tanks, CNS submitted a PHS application to the NYSDEC to update the PHS record. See Appendix B: PHS Application.

Upon removal, PAL placed the UST's on white polyethylene sheeting and CNS completed a visual inspection of the excavated UST's. The visual inspection did not identify any pitting, penetrations or holes on any of the three UST's. CNS also inspected the excavation area, which extended to an approximate depth of 6-foot bgs and did not identify any visual evidence of a petroleum product release or odors. The excavated and stockpiled soils were screened continuously with a RAE Systems PID. This PID was calibrated using both fresh air calibration (zero point) and single sensor calibration (second

point). Single sensor calibration was conducted by applying a known amount of reference gas to each sensor. PID readings during excavation ranged from 52 parts per million (ppm) to 3.0 ppm. Prior to collecting end-point soil samples PID readings ranged from 0.0 parts per million (ppm) to 1.2 ppm.

Upon completion of the excavation, CNS collected a total of five soil end-point samples. Endpoint soil samples were subsequently labeled EP-NW-51A through EP-RE-55A. See Figure III: Excavation Areas and End-point Sample Locations. The collected end-point soil samples were placed in laboratory-supplied glassware, packed in ice-filled coolers accompanied by chain-of-custody documentation and transported to Phoenix Environmental Laboratories, Inc. located at 587 East Middle Turnpike, Manchester, CT 06040. The samples were collected in accordance with USEPA "Test Methods for Evaluating Solid Waste, Physical-Chemical Methods" (SW-846) and analyzed for VOCs and SVOCs in accordance with NYSDEC Stem Protocols under EPA analytical Methods 8260 and 8270. See Appendix C: Chain of Custody Record and Laboratory Analytical Data Sheets – Soil Endpoint samples.

Analyte	Contaminant	EP-NW-51A	EP-NW-52A	EP-NW-53A	EP-NW-54A	EP-RE-55A	NYSDEC MCL/DCL
		ppm					
VOC	1,1,1-Trichloroethane	ND	ND	ND	ND	ND	17
	1,1,2-Trichloroethane	ND	ND	ND	ND	ND	1.1
	o-Xylenes	ND	ND	ND	ND	ND	1.2
	p-Xylenes	ND	ND	ND	ND	ND	18
	Toluene	ND	ND	ND	ND	ND	1.4
	Total Xylenes	ND	ND	ND	ND	ND	2.4
ETOC	Area Detected above Laboratory Maximum Detection Limit						ND

As depicted in the table above, the end-point sample analytical results were compared against the NYSDEC's Technical and Administrative Guidance Memorandum #4046 (TAGM) Recommended Soil Cleanup Objectives (RSCOs) and did not identify any VOC and SVOC constituents exceeding the objectives.

Based upon endpoint sample results, PID readings and lack of odors and visual evidence of a product release, CNS permitted PAL to backfill the excavation area. Due to the limited access within the basement, the USTs were underlain and overlain with white polyethylene sheeting awaiting disposal. The said USTs will be disposed of during future redevelopment activities at the subject site.

4.0 Groundwater Remediation

After assessing the nature and extent of the contamination at the subject site, the remedial action proposed by CNS to achieve a *No Further Action* status for site contamination is the utilization of RegenOx™ injection application.

4.1 Soil Objectives

Based upon past and current analytical results, VOC soil contamination is not present within the subject site.

4.2 Groundwater Objectives

To achieve groundwater remediation levels, RegenOx™ application was applied within the exposed excavation pit as outlined within the RAP. The area of contamination where contaminants detected exceeded the NYSDEC TAGM 0046 RSCO'S Groundwater Standards was found to cover an area of approximately 2,210 ft², respectively. See Figure III for Contamination Phase Location Plan.

4.3 Subsurface Injection

A total of 300 pounds was mixed and injected into the contaminated groundwater plume as outlined within the approved CNS RAP. The direct injection was completed utilizing a 5-GLT hydraulic direct push Geoprobe™ with a hydraulic mounted/powered GS200 Injection Machine, which advanced the RegenOx™ application into the aquifer.

The RegenOx™ application consisted of two parts of product that was mixed on-site using water as a dilution as directed by the manufacturer and then pressure injected into the contamination plume. Part A is manufactured in a pellet form consisting of a mixture of sodium percarbonate [2Na₂CO₃ · 3H₂O₂], sodium carbonate [Na₂CO₃], sodium silicate and silica gel and Part B, the catalyst, is manufactured in liquid form consisting of a mixture of sodium silicate solution, silica gel and ferrous sulfate.

5.0 Post-Injection Groundwater Sampling

Following the chemical injection, CNS completed post-injection groundwater sampling on September 30, 2009 where a total of four (4) groundwater samples were collected from the existing on-site monitoring wells subsequently labeled MW-1 through MW-4. Prior to sampling the wells were purged of 3 to 5 well volumes utilizing a low flow submersible pump with disposable tubing. The samples were collected in accordance with USEPA "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (SW-846) and analyzed for VOCs and SVOCs in accordance with NYSDEC State Protocols under EPA analytical Methods 8260 and 8270. As stated herein, baseline groundwater samples were collected from the four (4) on-site monitoring wells on May 12, 2009, which identified VOC contamination exceeding the NYSDEC Groundwater Standards.

The collected samples were placed in laboratory-supplied glassware, packed in ice-filled coolers accompanied by chain-of-custody documentation and transported to Phoenix Environmental Laboratories, Inc. located at 587 East Middle Turnpike in Manchester, Connecticut for analysis via on-site pick up. See Appendix D: Chain of Custody Record and Laboratory Analytical Data Sheets – Post-Injection Groundwater Samples.

CNS measured the depth to groundwater from the top of the casings within each monitoring well utilizing an electronic Keck Water Level Meter and groundwater measurement parameters were completed utilizing a YSI-556 Multi-Parameter unit. As indicated in the table on the following page, temperature levels ranged between 66.94°F through 68.17°F within an average temperature of 67.6°F. pH levels ranged between 7.23 through 9.98. Dissolved Oxygen levels ranged between 3.99 through 9.85 mg/L. Qualitative ORP levels ranged from +106.3 through -12.2.

Monitoring Well #	MW-1	MW-2	MW-3	MW-4
Date	8/26/2009	8/26/2009	8/26/2009	8/26/2009
Depth to Groundwater	18.75'	18.75'	18.67'	18.97'
Time Collected	10:14	10:30	10:27	10:20
Temperature (°C)	12.36	12.41	12.17	12.36
Dissolved Oxygen (mg/L)	7.56	7.21	7.48	7.79
Dissolved Oxygen (ppb)	6.87	6.59	6.83	7.07
pH	7.30	6.41	6.98	7.22
ORP	-87.7	-82.2	-100.2	-88.2

The collected groundwater samples were compared against the NYSDEC's Technical & Operational Guidance Series (TOGS) 3.1.1 Ambient Water Quality Standards and Groundwater Effluent Limitations. A summary of the detected constituents is presented in the table below.

Group	Constituent	MW-1		MW-2		MW-3		MW-4		NYSDEC Groundwater Standard
		8/26/09	8/1/07	8/26/09	8/1/07	8/26/09	8/1/07	8/26/09	8/1/07	
VOC	1,1,1-Trichloroethane	ND	ND	ND	ND	ND	ND	ND	ND	10
	1,1-Dichloroethane	ND	ND	ND	ND	ND	ND	ND	ND	10
	Benzene	ND	ND	ND	ND	ND	ND	ND	ND	10
	1,2-Dichloroethane	ND	ND	ND	ND	ND	ND	ND	ND	10
	Chlorobenzene	ND	ND	ND	ND	ND	ND	ND	ND	10
	1,1,2-Trichloroethane	ND	ND	ND	ND	ND	ND	ND	ND	10
	1,2-Dichlorobenzene	ND	ND	ND	ND	ND	ND	ND	ND	10
	1,1-Dichloroethene	ND	ND	ND	ND	ND	ND	ND	ND	10
	1,1,1-Trichloroethene	ND	ND	ND	ND	ND	ND	ND	ND	10
	1,1,2-Dichloroethene	ND	ND	ND	ND	ND	ND	ND	ND	10
	1,2-Dichloroethene	ND	ND	ND	ND	ND	ND	ND	ND	10
	1,1-Dichloroethane	ND	ND	ND	ND	ND	ND	ND	ND	10
	1,1,2-Dichloroethane	ND	ND	ND	ND	ND	ND	ND	ND	10
1,1,2-Trichloroethane	ND	ND	ND	ND	ND	ND	ND	ND	10	
SVOC	Naphthalene	ND	ND	ND	ND	ND	ND	ND	ND	10

As indicated in the table above, VOC constituents consisting of Trimethylbenzenes, Benzene, Ethylbenzene, Isopropylbenzene, Xylenes, Naphthalene, n-Butylbenzene, n-Propylbenzene, p-Isopropyltoluene and Toluene, respectively, and the SVOC Naphthalene were identified above the NYSDEC's TOGS Groundwater Standards in monitoring wells MW-1, MW-2 and MW-3; however when compared against the baseline sampling event, contaminant levels have been significantly reduced since chemical injections were applied.

6.0 Conclusion

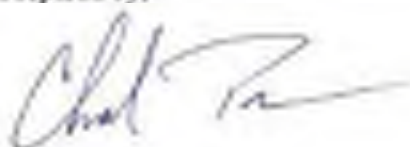

CNS has implemented the approved RAP as directed by the NYSDEC. As noted herein, end-point soil analytical results associated with the UST excavation area did not identify any VOC or SVOC constituents above the NYSDEC ESCOs, therefore, CNS requests that no further action be required regarding the soils.

CNS completed the RegenOx™ direct injection to encapsulate the identified phase from past and current analytical results. Post-injection groundwater analytical results identified VOC and SVOC compounds above the NYSDEC's TOGS guideline; however have been drastically reduced following the chemical application. As indicated in the RAP, CNS will proceed to complete with quarterly groundwater monitoring to monitor the injection remediation progress starting with the fourth quarter of 2009.

Subject: Re: Spill #09-02240 - Remedial Action Plan

Joanna,

I reviewed the proposed RMP and approve. The proposed 1" monitoring wells should be installed prior to the injections to gain baseline levels. Please let me know when the work is scheduled and keep me informed as to the progress. Thank you.

Ryan M. Piper

Engineering Geologist I

Project ID: 4650 BROADWAY NEW YORK
Sample IDs: AZ16010 - AZ19014

This laboratory is in compliance with the QA/QC procedures outlined in EPA 600/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, SW846 QA/QC and NELAP requirements of procedures used.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

A handwritten signature in black ink, appearing to read "Phyllis Shiller".

Phyllis Shiller
Laboratory Director

Mr. Ryan Piper
New York State Department of Environmental Conservation
Division of Environmental Remediation, Region 2
1 Hunter's Point Plaza
47-49 21st Street
Long Island City, NY 11101

Re: Groundwater Sampling - March 2010
Site: 4650 Broadway, New York, NY 10040
NYSDEC Spill # 09-02240
CNS Job #: 820682

Dear Mr. Piper,

On Monday, March 29, 2010, CNS Management Corp. (CNS) collected groundwater samples from four (4) existing monitoring wells located at 4650 Broadway in New York, New York; referred to hereafter as the subject site. See Figure 1. Site Location Map.

Background

Based on findings of a subsurface investigation, gasoline contamination was identified within the groundwater at the subject site. Based on these findings CNS completed and executed a NYSDEC approved Remedial Action Plan dated June 12, 2009 (NYSDEC RAP Approval Email dated July 10, 2009), bound under a separate cover, which consisted of the removal of Underground Storage Tanks (UST) and associated impacted soils, if applicable; and the installation of monitoring wells and utilizing RegenOx™ chemical oxidizer injections, to effectively remediate the groundwater. Note: prior to the RegenOx™ application, CNS collected a round of groundwater samples from each monitoring well to establish a site baseline. The previous rounds of quarterly sampling were performed on 9/30/2009 and 12/29/2009.

Upon completion of remediation, CNS submitted a Remediation Report (*Remediation Report* dated October 22, 2009 bound under a separate cover) and was subsequently directed by the NYSDEC to collect quarterly groundwater samples.

Field Activities

Groundwater samples were collected from the four (4) existing on-site monitoring wells labeled MW-1 through MW-4 (See Figure II: Monitoring Well Locations). Prior to collecting the groundwater samples, CNS measured the depth to groundwater from the top of the well casings utilizing an electronic Keck Water Level Meter.

Prior to sampling, the wells were purged of 3 to 5 well volumes utilizing a low flow submersible pump with disposable tubing. In addition, after the final well purge within each monitoring well, measurements for temperature, conductivity, pH, dissolved oxygen and oxygen-reduction potential (ORP) were

collected, utilizing a YSI 356 Multi Probe System within non-chemically analyzed clean sample jars. See Table 1 for Groundwater Measurements.

The collected groundwater samples were collected in accordance with USEPA, "Test Methods for Evaluating Solid Waste, Physical-Chemical Methods" (SW-846) and analyzed for VOCs and SVOCs in accordance with NYSDEC State Protocols under EPA analytical Methods 8260 and 8270. The groundwater samples were placed in laboratory supplied glassware, packed in an ice-filled cooler accompanied by chain-of-custody documentation and picked up onsite by Phoenix Environmental Laboratories, Inc. and transported to their facility located at 587 East Middle Turnpike, Marchmont, CT 06040. See Appendix A for Laboratory Analytical Data Sheets.

The collected groundwater samples were compared against the NYSDEC's Technical & Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Groundwater Effluent Limitations (NYSDEC Groundwater Standards). A summary of the analytical results in the table overleaf.

Groundwater Measurement Parameters

As indicated in Table 1 below, temperature levels ranged between 52.63°F through 56.87°F with an average temperature of 54.15°F. pH levels ranged between 12.13 through 13.56. Dissolved Oxygen levels ranged between 0.005 through 2.46 mg/l. Qualitative ORP levels ranged from 7.22 through 7.35.

Groundwater Analytical Result Interpretation

The subject site's baseline groundwater sampling event occurred on 5/12/2009 prior to the RegenCre™ application. Current analytical results compared to the NYSDEC Groundwater Standards are summarized below and shown within Table II on the preceding pages.

Monitoring well MW-1 has shown an increase in VOC contamination where multiple VOC constituents and SVOC Naphthalene were detected at levels exceeding the NYSDEC Groundwater Standards.

An increase in contaminant levels was also identified in monitoring well MW-2 which was last identified at non-detect levels, where the VOC's 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene, Isopropylbenzene, m,p-Xylene, n-Propylbenzene, o-Xylene and p-Isopropyltoluene were reported above the NYSDEC Groundwater Standards. SVOC constituents remain non-detected.

Monitoring well MW-3 has slightly increased in VOC contaminant levels where the detected contaminants were identified above the NYSDEC Groundwater Standards, respectively.

Monitoring well MW-4 remains with VOC and SVOC levels below the NYSDEC Groundwater Standards or at non-detectable levels.

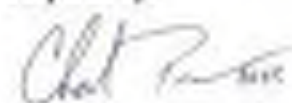

Conclusions

Gasoline related contamination remains present at the subject site from the past underground storage tanks as observed within the past subsurface investigation and groundwater sampling completed by CNS. Analytical results did not identify contaminants within monitoring well MW-4 and contaminants were identified exceeding the standards within monitoring wells MW-1, MW-2 and MW-3. Monitoring wells were identified with a slight increase in VOC contaminant levels, with the highest amount of contaminants continuing to be within monitoring well MW-1, respectively.

As indicated in Table I, the groundwater measurement parameters of temperature, pH, dissolved oxygen and oxygen-reduction potential (ORP) indicate favorable ranges for active oxidation and microorganisms; however these levels need to be substantiated via further monitoring. The next groundwater sampling event is scheduled for June of 2010.

Enclosed within this report are site drawings and laboratory analytical results. If you have any questions or require any additional information please call me at (516) 932-3228.

Plainville, NY 11803-4307

Project ID: E28682
Sample IDs: A588002 - A588005

This laboratory is in compliance with the QA/QC procedures outlined in EPA 600/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, SW846 QA/QC and NELAP requirements of procedures used.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

A handwritten signature in black ink that reads "Phyllis Shiller". The signature is written in a cursive style.

Re: Groundwater Sampling – June 2010
Site: 4650 Broadway, New York, NY 10040
NYSDEC Spill # 09-02240
CNS Job #: 820682

Dear Mr. Piper,

On Monday, June 28, 2010, CNS Management Corp. (CNS) collected groundwater samples from four (4) existing monitoring wells located at 4650 Broadway in New York, New York; referred to hereafter as the subject site. See Figure I: Site Location Map.

Background

Based on findings of a subsurface investigation, gasoline contamination was identified within the groundwater at the subject site. Based on these findings CNS completed and executed a NYSDEC approved Remedial Action Plan dated June 12, 2009 (NYSDEC RAP Approval Email dated July 10, 2009), bound under a separate cover, which consisted of the removal of Underground Storage Tanks (UST) and associated impacted soils, if applicable; and the installation of monitoring wells and utilizing RegenOx™ chemical oxidizer injections, to effectively remediate the groundwater. Note: prior to the RegenOx™ application, CNS collected a round of groundwater samples from each monitoring well to establish a site baseline. The previous rounds of quarterly sampling were performed on 9/30/2009, 12/29/2009 and 3/29/2010.

Upon completion of remediation, CNS submitted a Remediation Report (*Remediation Report* dated October 22, 2009 bound under a separate cover) and was subsequently directed by the NYSDEC to collect quarterly groundwater samples.

Field Activities

Groundwater samples were collected from the four (4) existing on-site monitoring wells labeled MW-1 through MW-4 (See Figure II: Monitoring Well Locations). Prior to collecting the groundwater samples, CNS measured the depth to groundwater from the top of the well casings utilizing an electronic Keck Water Level Meter.

Prior to sampling, the wells were purged of 3 to 5 well volumes utilizing a low flow submersible pump with disposable tubing. In addition, after the final well purge within each monitoring well, measurements for temperature, conductivity, pH, dissolved oxygen and oxygen-reduction potential (ORP) were

collected, utilizing a YSI 355 Multi Probe System within non-chemically analyzed clean sample jars. See Table 1 for Groundwater Measurements.

The collected groundwater samples were collected in accordance with USEPA "Test Methods for Evaluating Solid Waste, Physical-Chemical Methods" (SW-846) and analyzed for VOCs and SVOCs in accordance with NYSDEC State Protocols under EPA analytical Methods 8260 and 8270. The groundwater samples were placed in laboratory supplied glassware, packed in an ice-filled cooler accompanied by chain-of-custody documentation and picked up onsite by Phoenix Environmental Laboratories, Inc. and transported to their facility located at 587 East Middle Turnpike, Marchant, CT 06040. See Appendix A for Laboratory Analytical Data Sheets.

The collected groundwater samples were compared against the NYSDEC's Technical & Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Groundwater Effluent Limitations (NYSDEC Groundwater Standards). A summary of the analytical results in the table overleaf.

Groundwater Measurement Parameters

As indicated in Table 1 below, temperature levels ranged between 62.32°F through 63.79°F with an average temperature of 63.14°F. pH levels ranged between 6.9 through 7.32. Dissolved Oxygen levels ranged between 2.08 through 5.39 mg/l. Qualitative ORP levels ranged from -225.7 through -160.0.

Table 1: Groundwater Measurements

 ND = Not Detected above Ministry's Method Detection Limit as Method of analysis and instrumentation
 Concentrations exceeding the NY's Groundwater Standards are highlighted in bold RED.

Groundwater Analytical Result Interpretation

The subject site's baseline groundwater sampling event occurred on 5/12/2009 prior to the RegenCre™ application. Current analytical results compared to the NYSDEC Groundwater Standards are summarized below and shown within Table II on the preceding pages.

A decrease in VOC and SVOC contaminant levels was reported monitoring well MW-1, where contaminants were identified at levels 50% lower than the previous sampling event, respectively, however continue to exceed the standards.

Monitoring well MW-2 has shown a slightly increase in VOC and SVOC contaminant levels, where each of the identified contaminants were at levels exceeding the NYSDEC Groundwater Standards.

Monitoring well MW-3 remains within the same general contaminant levels when compared against the previous sampling event, where several VOC contaminants remains above the NYSDEC Groundwater Standards. SVOC contaminants were identified below the standards.

A slight increase in levels is demonstrated within monitoring well MW-4, where 1,2,4-Trimethylbenzene, m,p-Xylene and o-Xylene were identified at levels exceeding the NYSDEC Groundwater Standards.

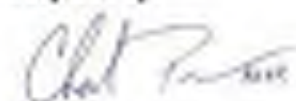

Conclusions

Gasoline related contamination remains present at the subject site from the past underground storage tanks as observed within the past subsurface investigation and groundwater sampling completed by CNS. Based upon analytical results, VOC contamination has been drastically reduced within monitoring well MW-1, although remains with the highest levels of contaminants when compared against the remaining three wells. Contaminants were identified within monitoring wells MW-2, MW-3 and MW-4 at levels exceeding the NYSDEC Groundwater Standards.

As indicated in Table I the groundwater measurement parameters of temperature, pH, dissolved oxygen and oxygen reduction potential (ORP) indicate favorable ranges for active oxidation and microorganisms, however these levels need to be substantiated via further monitoring. The next groundwater sampling event is scheduled for September of 2010.

Enclosed within this report are site drawings and laboratory analytical results. If you have any questions or require any additional information please call me at (516) 932-3228.

Laboratory Analytical Report w/ Chain of Custody

Tuesday, July 13, 2010

Attn: Mr. Charles Powers
CNS Management Corp
208 Newtown Road
Plainville, NY 11803-4307

Project ID: 4650 BROADWAY NEW YORK
Sample IDs: AZ16015 - AZ19018

This laboratory is in compliance with the QA/QC procedures outlined in EPA 600/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, SW846 QA/QC and NELAP requirements of procedures used.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

A handwritten signature in black ink, appearing to read "Phyllis Shiller".

Re: Groundwater Sampling - September 2009
Site: 4650 Broadway, New York, NY 10040
NYSDEC Spill # 09-02240
CNS Job #: 820682

Dear Mr. Piper,

On Thursday, September 30, 2010, CNS Management Corp. (CNS) collected groundwater samples from four (4) existing monitoring wells located at 4650 Broadway in New York, New York; referred to hereafter as the subject site. See Figure I: Site Location Map.

Background

Based on findings of a subsurface investigation, plume contamination was identified within the groundwater at the subject site. Based on these findings CNS compiled and executed a NYSDEC approved Remedial Action Plan dated June 12, 2009 (NYSDEC RAP Approval Email dated July 10, 2009), bound under a separate cover, which consisted of the removal of Underground Storage Tanks (UST) and associated impacted soils, if applicable; and the installation of monitoring wells and utilizing RegenOx™ chemical oxidizer injections, to effectively remediate the groundwater. Note: prior to the RegenOx™ application, CNS collected a round of groundwater samples from each monitoring well to establish a site baseline. The previous rounds of quarterly sampling were performed on 9/30/2009, 12/29/2009, 3/29/2010 and 6/29/2010.

Upon completion of remediation, CNS submitted a Remediation Report (Remediation Report dated October 22, 2009 bound under a separate cover) and was subsequently directed by the NYSDEC to collect quarterly groundwater samples.

Field Activities

Groundwater samples were collected from the four (4) existing on-site monitoring wells labeled MW-1 through MW-4 (See Figure II: Monitoring Well Locations). Prior to collecting the groundwater samples, CNS measured the depth to groundwater from the top of the well casings utilizing an electronic Kock Water Level Meter.

Prior to sampling, the wells were purged of 3 to 5 well volumes utilizing a low flow submersible pump with disposable tubing. In addition, after the final well purge within each monitoring well, measurements for temperature, conductivity, pH, dissolved oxygen and oxygen-reduction potential (ORP) were

collected, utilizing a YSI 356 Multi Probe System within non-chemically analyzed clean sample jars. See Table I for Groundwater Measurements.

The collected groundwater samples were collected in accordance with USEPA "Test Methods for Evaluating Solid Waste, Physical-Chemical Methods" (SW-846) and analyzed for VOCs and SVOCs in accordance with NYSDEC State Protocols under EPA analytical Methods 8260 and 8270. The groundwater samples were placed in laboratory supplied glassware, packed in an ice-filled cooler accompanied by chain-of-custody documentation and picked up onsite by Phoenix Environmental Laboratories, Inc. and transported to their facility located at 587 East Middle Turnpike, Marchmont, CT 06040. See Appendix A for Laboratory Analytical Data Sheets.

The collected groundwater samples were compared against the NYSDEC's Technical & Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Groundwater Effluent Limitations (NYSDEC Groundwater Standards). A summary of the analytical results in the table overleaf.

Groundwater Measurement Parameters

As indicated in Table I on the following page, temperature levels ranged between 59.59°F through 69.41°F with an average temperature of 66.73°F. pH levels ranged between 7.66 through 7.32. Dissolved Oxygen levels ranged between 1.01 through 3.3 mg/l. Qualitative ORP levels ranged from -217.8 through -163.3.

Groundwater Analytical Result Interpretation

The subject site's baseline groundwater sampling event occurred on 5/12/2009 prior to the RepexOx™ application. Current analytical results compared to the NYSDEC Groundwater Standards are summarized below and shown within Table II on the following pages.

Monitoring wells MW-1 and MW-2 have both been identified with slight increases in contaminant levels, where the VOC's VOC's 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene, Benzene, Ethylbenzene, Isopropylbenzene, m,p-Xylene, Naphthalene, n-Propylbenzene, o-Xylene, sec-Butylbenzene and tert-Butylbenzene, respectively, were detected at levels exceeding the NYSDEC Groundwater Standards. Additionally, the SVOC Naphthalene was also identified exceeding the standards within both monitoring wells.

Monitoring well MW-3 remains within the same general contaminant levels when compared against the previous two sampling events, where several VOC contaminants remain above the NYSDEC Groundwater Standards. The SVOC Benzo (a) anthracene was also identified just above the groundwater standard of 0.001ppb.

Monitoring well MW-4 was also reported with a slight increase, where VOC's 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene, Ethylbenzene, m,p-Xylene and o-Xylene were identified above the standards. SVOC concentration remains at non-detect.

Notes: MDEQ/DOH standards - New York State Department of Environmental Conservation, Title 19 of the Code of Official Regulations
 MCL - State Indicator above Secretary's Minimum Indicator Limit as Minimum Analysis and Enforcement
 Concentrations exceeding the MCL/Secretary's Standard are highlighted in red.

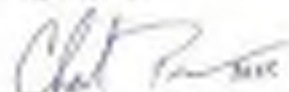

Conclusions

Gasoline related contamination remains present at the subject site from the past underground storage tanks as observed within the past subsurface investigation and groundwater sampling completed by CNS. Based upon analytical results, groundwater contaminant levels remain unchanged or slightly increased when compared against the previous June 2010 sampling event.

As indicated in Table 1, the groundwater measurement parameters of temperature, pH, dissolved oxygen and oxygen reduction potential (ORP) indicate favorable ranges for active oxidation and microorganisms; however these levels need to be substantiated via further monitoring. The next groundwater sampling event is scheduled for December of 2010.

Enclosed within this report are site drawings and laboratory analytical results. If you have any questions or require any additional information please call me at (516) 932-3228.

Laboratory Analytical Report w/ Chain of Custody

Friday, October 08, 2010

Attn: Mr. Charles Powers
CNS Management Corp
208 Newtown Road
Plainville, NY 11803-4307

Project ID: E28682
Sample IDs: A261018 - A261021

This laboratory is in compliance with the QA/QC procedures outlined in EPA 600/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, SW846 QA/QC and NELAP requirements of procedures used.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

A handwritten signature in black ink, appearing to read "Phyllis Shiller".

Re: Groundwater Sampling - December 2010
Site: 4658 Broadway, New York, NY 10040
NYSDEC Spill # 09-02240
CNS Job #: 820682

Dear Mr. Piper,

On Thursday, December 30, 2010, CNS Management Corp. (CNS) collected groundwater samples from four (4) existing monitoring wells located at 4658 Broadway in New York, New York, referred to hereafter as the subject site. See Figure I: Site Location Map.

Background

Based on findings of a subsurface investigation, gasoline contamination was identified within the groundwater at the subject site. Based on these findings CNS completed and executed a NYSDER approved Remedial Action Plan dated June 12, 2009 (NYSDER RAP Approval Email dated July 10, 2009), bound under a separate cover, which consisted of the removal of Underground Storage Tanks (UST) and associated impacted soils, if applicable; and the installation of monitoring wells and utilizing RegenOx™ chemical oxidizer injections, to effectively remediate the groundwater. Note: prior to the RegenOx™ application, CNS collected a round of groundwater samples from each monitoring well to establish a site baseline.

Upon completion of remediation, CNS submitted a Remediation Report (Remediation Report dated October 22, 2009 bound under a separate cover) and was subsequently directed by the NYSDER to collect quarterly groundwater samples. The previous rounds of quarterly sampling were performed on 9/30/2009, 12/29/2009, 3/29/2010, 6/28/2010 and 9/30/2010.

Field Activities

Groundwater samples were collected from the four (4) existing on-site monitoring wells labeled MW-1 through MW-4 (See Figure II: Monitoring Well Locations). Prior to collecting the groundwater samples, CNS measured the depth to groundwater from the top of the well casings utilizing an electronic Keck Water Level Meter.

Prior to sampling, the wells were purged of 3 to 5 well volumes utilizing a low flow submersible pump with disposable tubing. In addition, after the final well purge within each monitoring well, measurements for temperature, conductivity, pH, dissolved oxygen and oxygen-reduction potential (ORP) were

collected, utilizing a YSI 356 Multi Probe System within non-chemically analyzed clean sample jars. See Table I for Groundwater Measurements.

The collected groundwater samples were collected in accordance with USEPA, "Test Methods for Evaluating Solid Waste, Physical-Chemical Methods" (SW-846) and analyzed for VOCs and SVOCs in accordance with NYSDEC State Protocols under EPA analytical Methods 8260 and 8270. The groundwater samples were placed in laboratory supplied glassware, packed in an ice-filled cooler accompanied by chain-of-custody documentation and picked up onsite by Phoenix Environmental Laboratories, Inc. and transported to their facility located at 587 East Middle Turnpike, Marchmont, CT 06040. See Appendix A for Laboratory Analytical Data Sheets.

The collected groundwater samples were compared against the NYSDEC's Technical & Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Groundwater Effluent Limitations (NYSDEC Groundwater Standards). A summary of the analytical results in the table overleaf.

Groundwater Measurement Parameters

As indicated in Table I on the following page, temperature levels ranged between 52.81°F through 56.8°F with an average temperature of 54.15°F. pH levels ranged between 5.45 through 6. Dissolved Oxygen levels ranged between 4.04 through 8.67 mg/L. Qualitative ORP levels ranged from -364.8 through -270.8.

Groundwater Analytical Result Interpretation

The subject site's baseline groundwater sampling event occurred on 5/12/2009 prior to the RegenOx™ application. Current analytical results compared to the NYSDEC Groundwater Standards are summarized below and shown within Table II on the following pages.

Monitoring well MW-1 has exhibited a significant decrease in contaminant levels, where the identified multiple VOCs and the SVOC Naphthalene, were reported at levels lower than all previous sampling events; however continue to exceed the NYSDEC Groundwater Standards.

Monitoring well MW-2 has also demonstrated a significant decrease, where the VOCs 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene, Ethylbenzene, m,p-Xylene, Naphthalene, n-Propylbenzene and o-Xylene have been reduced by almost 50% although continue to remain above the groundwater standards. The SVOC constituent Naphthalene, was non-detected above the laboratory's minimum detection limit.

Monitoring well MW-3 has displayed a significant decrease in VOC contamination, which has been reduced by approximately 50% when compared against the previous sampling event. SVOC constituents were not detected above the groundwater standards.

Monitoring well MW-4 has remained with relatively unchanged VOC constituent levels, which are slightly exceeding the NYSDEC Groundwater Standards; however the well has also remained with the lowest contaminant levels since the baseline sampling event.

Table I: Groundwater Measurements

Conclusions

Gasoline related contamination remains present at the subject site from the past underground storage tanks as observed within the past subsurface investigation and groundwater sampling completed by CNS. Based upon analytical results, VOC contamination has decreased within monitoring wells MW-1, MW-2 and MW-3, with contaminant levels in monitoring well MW-4 remaining relatively unchanged.

As indicated in Table 1, the groundwater measurement parameters of temperature, pH, dissolved oxygen and oxygen reduction potential (ORP) indicate favorable ranges for active oxidation and microorganisms; therefore CNS will continue to monitor the groundwater contaminant levels at the subject site. The next groundwater sampling event is scheduled for March of 2011.

Enclosed within this report are site drawings and laboratory analytical results. If you have any questions or require any additional information please call me at (516) 932-3228.

Laboratory Analytical Report w/ Chain of Custody

Thursday, January 06, 2011

Attn: Mr. Charles Powers
CNS Management Corp
208 Newtown Road
Plainville, NY 11803-4307

Project ID: E28682
Sample IDs: A292222 - A292226

This laboratory is in compliance with the QA/QC procedures outlined in EPA 600/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, SW846 QA/QC and NELAP requirements of procedures used.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

A handwritten signature in black ink, appearing to read "Phyllis Shiller".

Site: 4650 Broadway, New York, NY 10040
NYSDEC Spill # 09-02240
CNS Job #: 820682

Dear Mr. Piper,

On Tuesday, March 29, 2011, CNS Management Corp. (CNS) collected groundwater samples from four (4) existing monitoring wells located at 4650 Broadway in New York, New York; referred to hereafter as the subject site. See Figure 1. Site Location Map.

Background

Based on findings of a subsurface investigation, gasoline contamination was identified within the groundwater at the subject site. Based on these findings CNS completed and executed a NYSDEC approved Remedial Action Plan dated June 12, 2009 (NYSDEC RAP Approval Email dated July 10, 2009), bound under a separate cover, which consisted of the removal of Underground Storage Tanks (UST) and associated impacted soils, if applicable; and the installation of monitoring wells and utilizing RegenOx™ chemical oxidizer injections, to effectively remediate the groundwater. Note: prior to the RegenOx™ application, CNS collected a round of groundwater samples from each monitoring well to establish a site baseline. The previous rounds of quarterly sampling were performed on 9/30/2009, 12/29/2009, 3/29/2010, 6/28/2010, 9/30/2010 and 12/30/2010.

Upon completion of remediation, CNS submitted a Remediation Report (*Remediation Report* dated October 22, 2009 bound under a separate cover) and was subsequently directed by the NYSDEC to collect quarterly groundwater samples.

Field Activities

Groundwater samples were collected from the four (4) existing on-site monitoring wells labeled MW-1 through MW-4 (See Figure II: Monitoring Well Locations). Prior to collecting the groundwater samples, CNS measured the depth to groundwater from the top of the well casings utilizing an electronic Keck Water Level Meter.

Prior to sampling, the wells were purged of 3 to 5 well volumes utilizing a low flow submersible pump with disposable tubing. In addition, after the final well purge within each monitoring well, measurements for temperature, conductivity, pH, dissolved oxygen and oxygen-reduction potential (ORP) were

collected, utilizing a YSI 356 Multi Probe System within non-chemically analyzed clean sample jars. See Table I for Groundwater Measurements.

The collected groundwater samples were collected in accordance with USEPA, "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (SW-846) and analyzed for VOCs and SVOCs in accordance with NYSDEC State Protocols under EPA analytical Methods 8260 and 8270. The groundwater samples were placed in laboratory supplied glassware, packed in an ice-filled cooler accompanied by chain-of-custody documentation and picked up onsite by Phoenix Environmental Laboratories, Inc. and transported to their facility located at 587 East Middle Turnpike, Marchmont, CT 06040. See Appendix A for Laboratory Analytical Data Sheets.

The collected groundwater samples were compared against the NYSDEC's Technical & Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Groundwater Effluent Limitations (NYSDEC Groundwater Standards). A summary of the analytical results in the table overleaf.

Groundwater Measurement Parameters

As indicated in Table I on the following page, temperature levels ranged between 48.9°F through 51.5°F with an average temperature of 50.73°F. pH levels ranged between 7.1 through 7.19. Dissolved Oxygen levels ranged between 5.37 through 6.84 mg/l. Qualitative ORP levels ranged from -159.5 through -139.9.

Groundwater Analytical Result Interpretation

The subject site's baseline groundwater sampling event occurred on 5/12/2009 prior to the RegenOx™ application. Current analytical results compared to the NYSDEC Groundwater Standards are summarized below and shown within Table II on the following pages.

A surge in VOC contamination was identified within monitoring well MW-1, accompanied by a strong petroleum odor during the sampling event. All VOC constituents analyzed, with exception to sec-butylbenzene and tert-butylbenzene, were identified exceeding the NYSDEC Groundwater Standards. Additionally, the SVOC contaminants Naphthalene and Benz(a)anthracene were also identified above the standards.

Monitoring wells MW-2 and MW-3 have demonstrated a slight increase in VOC contaminant levels with no SVOC contamination identified exceeding the standards. 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene, Benzene, Ethylbenzene, Isopropylbenzene, m,p-Xylene, Naphthalene, o-Propylbenzene and o-Xylene, were detected at levels exceeding the NYSDEC Groundwater standards.

Monitoring well MW-4 has shown a decrease in levels where VOC contaminants 1,2,4-Trimethylbenzene and m,p-Xylene are the only constituents slightly exceeding the groundwater standards.

Conclusions

Gasoline related contamination remains present at the subject site from the past underground storage tanks as observed within the past subsurface investigation and groundwater sampling completed by CNS. Monitoring well MW-1 was identified with a strong petroleum odor at the time of sampling with results indicating higher levels of VOC contamination than the previous sampling events. Monitoring wells MW-2 and MW-3 exhibited a slight increase in VOC contaminant levels, while monitoring well MW-4 was identified with a slight decrease in VOC levels.

During the sampling event, CNS did not identify any changes in site conditions which would be attributed to these high levels of VOC contamination identified within monitoring well MW-1; therefore CNS will continue to monitor the groundwater contaminant levels at the subject site. The next groundwater sampling event is scheduled for June of 2011.

Enclosed within this report are site drawings and laboratory analytical results. If you have any questions or require any additional information please call me at (516) 932-3228.

Comments:

E = Estimated value. Sample result was above the calibration range. Subsequent dilution did not correlate well with original analysis results. Insufficient sample provided for further dilution.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

Re: Groundwater Sampling – June 2011
Site: 4650 Broadway, New York, NY 10040
NYSDEC Spill # 09-02240
CNS Job #: 820682

Dear Mr. Piper,

On Tuesday, June 28, 2011, CNS Management Corp. (CNS) collected groundwater samples from four (4) existing monitoring wells located at 4650 Broadway in New York, New York; referred to hereafter as the subject site. See Figure I: Site Location Map.

Background

Based on findings of a subsurface investigation, gasoline contamination was identified within the groundwater at the subject site. Based on these findings CNS completed and executed a NYSDEC approved Remedial Action Plan dated June 12, 2009 (NYSDEC RAP Approval Email dated July 10, 2009), bound under a separate cover, which consisted of the removal of Underground Storage Tanks (UST) and associated impacted soils, if applicable; and the installation of monitoring wells and utilizing RegenOx™ chemical oxidizer injections, to effectively remediate the groundwater. Note: prior to the RegenOx™ application, CNS collected a round of groundwater samples from each monitoring well to establish a site baseline. The previous rounds of quarterly sampling were performed on 9/30/2009, 12/29/2009, 3/29/2010, 6/28/2010, 9/30/2010, 12/30/2010 and 5/29/2011.

Upon completion of remediation, CNS submitted a Remediation Report (*Remediation Report* dated October 22, 2009 bound under a separate cover) and was subsequently directed by the NYSDEC to collect quarterly groundwater samples.

Field Activities

Groundwater samples were collected from the four (4) existing on-site monitoring wells labeled MW-1 through MW-4 (See Figure II: Monitoring Well Locations). Prior to collecting the groundwater samples, CNS measured the depth to groundwater from the top of the well casings utilizing an electronic Keck Water Level Meter.

Prior to sampling, the wells were purged of 3 to 5 well volumes utilizing a low flow submersible pump with disposable tubing. In addition, after the final well purge within each monitoring well, measurements for temperature, conductivity, pH, dissolved oxygen and oxygen-reduction potential (ORP) were

collected, utilizing a YSI 356 Multi Probe System within non-chemically analyzed clean sample jars. See Table I for Groundwater Measurements.

The collected groundwater samples were collected in accordance with USEPA, "Test Methods for Evaluating Solid Waste, Physical-Chemical Methods" (SW-846) and analyzed for VOCs and SVOCs in accordance with NYSDEC State Protocols under EPA analytical Methods 8260 and 8270. The groundwater samples were placed in laboratory supplied glassware, packed in an ice-filled cooler accompanied by chain-of-custody documentation and picked up onsite by Phoenix Environmental Laboratories, Inc. and transported to their facility located at 587 East Middle Turnpike, Marchant, CT 06040. See Appendix A for Laboratory Analytical Data Sheets.

The collected groundwater samples were compared against the NYSDEC's Technical & Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Groundwater Effluent Limitations (NYSDEC Groundwater Standards). A summary of the analytical results in the table overleaf.

Groundwater Measurement Parameters

As indicated in Table I on the following page, temperature levels ranged between 63.54°F through 65.76°F with an average temperature of 64.6°F. pH levels ranged between 7.35 through 8.1. Dissolved Oxygen levels ranged between 3.33 through 5.35 mg/l. Qualitative ORP levels ranged from -233.5 through -135.8.

Groundwater Analytical Results Interpretation

The subject site's baseline groundwater sampling event occurred on 5/32/2009 prior to the RegenOx™ application. Current analytical results compared to the NYSDEC Groundwater Standards are summarized below and shown within Table II on the following pages.

Monitoring well MW-1 continues to exhibit higher contaminant levels with a strong petroleum odor detected during sampling; however VOC levels have significantly decreased since the previous sampling event but remain above the standards. The SVOC contaminant Naphthalene has exhibited a slight increase and continues to remain above the standard of 10ppb.

Monitoring well MW-2 has demonstrated an increase in contaminant levels, where the VOC constituents identified exceed the NYSDEC Groundwater Standards. In addition, the SVOC contaminant Naphthalene was also detected exceeding the standards at 62 ppb.

Monitoring well MW-3 has remained with relatively unchanged VOC contaminant levels when compared against the previous sampling event, where most of the identified VOCs exceed the groundwater standards. SVOC Naphthalene was also detected slightly above the standards at 15 ppb.

Monitoring well MW-4 has continued to demonstrate a decrease in VOC contaminant levels where 1,2,4-Trimethylbenzene and m,p-Xylene continue to be the only constituents slightly exceeding the standards.

Note: NYSDDEC Class Standards = New York State Department of Environmental Conservation TOGS 1.1 Class CA Groundwater Standards/Criteria
 ND = None Detected above laboratory's Minimum Detectable Limit or Method of Analysis and instrumentation.
 Concentrations exceeding the M33 Groundwater Standards are highlighted in bold RED.

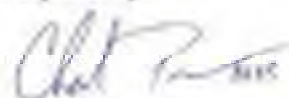

Conclusions

Gasoline related contamination remains present at the subject site from the past underground storage tanks as observed within the past subsurface investigation and groundwater sampling completed by CNS. Based upon analytical results, VOC contaminant levels have been reduced within monitoring well MW-1 since the previous sampling event, although remain with the highest levels of contaminants when compared against the remaining three wells. Monitoring wells MW-2, MW-3 and MW-4 remain with contaminants above the NYSDEC Groundwater Standards, however vary with slight increases and decreases dependent on seasonal fluctuations.

As indicated in Table 1, the groundwater measurement parameters of temperature, pH, dissolved oxygen and oxygen-reduction potential (ORP) indicate favorable ranges for active oxidation and microorganisms; therefore CNS will continue to monitor the groundwater contaminant levels at the subject site. The next groundwater sampling event is scheduled for September of 2011.

Enclosed within this report are site drawings and laboratory analytical results. If you have any questions or require any additional information please call me at (516) 932-3228.

Laboratory Analytical Report w/ Chain of Custody

Wednesday, July 06, 2011

Attn: Mr. Charles Powers
CNS Management Corp
288 Newtown Road
Plainville, NY 11803-4307

Project ID: 4650 BROADWAY NY
Sample IDs: BA47801 - BA47804

This laboratory is in compliance with the QA/QC procedures outlined in EPA 800/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, SW846 QA/QC and MELAC requirements of procedures used.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

A handwritten signature in black ink, appearing to read "Phyllis Shiller".

Re: Groundwater Sampling - October 2011
Site: 4650 Broadway, New York, NY 10040
NYSDEC Spill # 09-02240
CNS Job #: 820682

Dear Mr. Piper,

On Friday, October 7, 2011, CNS Management Corp. (CNS) collected groundwater samples from four (4) existing monitoring wells located at 4650 Broadway in New York, New York; referred to hereafter as the subject site. See Figure I: Site Location Map.

Background

Based on findings of a subsurface investigation, gasoline contamination was identified within the groundwater at the subject site. Based on these findings CNS completed and executed a NYSDEC approved Remedial Action Plan dated June 12, 2009 (NYSDEC RAP Approval Email dated July 10, 2009), bound under a separate cover, which consisted of the removal of Underground Storage Tanks (UST) and associated impacted soils, if applicable; and the installation of monitoring wells and utilizing RegenOx™ chemical oxidizer injections, to effectively remediate the groundwater. Note: prior to the RegenOx™ application, CNS collected a round of groundwater samples from each monitoring well to establish a site baseline. The previous rounds of quarterly sampling were performed on 9/30/2009, 12/29/2009, 3/29/2010, 6/28/2010, 9/30/2010, 12/30/2010, 3/29/2011 and 6/28/2011.

Upon completion of remediation, CNS submitted a Remediation Report (*Remediation Report* dated October 22, 2009 bound under a separate cover) and was subsequently directed by the NYSDEC to collect quarterly groundwater samples.

Field Activities

Groundwater samples were collected from the four (4) existing on-site monitoring wells labeled MW-1 through MW-4 (See Figure II: Monitoring Well Locations). Prior to collecting the groundwater samples, CNS measured the depth to groundwater from the top of the well casings utilizing an electronic Keck Water Level Meter.

Prior to sampling, the wells were purged of 3 to 5 well volumes utilizing a low flow submersible pump with disposable tubing. In addition, after the final well purge within each monitoring well, measurements for temperature, conductivity, pH, dissolved oxygen and oxygen-reduction potential (ORP) were

collected, utilizing a YSI 356 Multi Probe System within non-chemically analyzed clean sample jars. See Table I for Groundwater Measurements.

The collected groundwater samples were collected in accordance with USEPA, "Test Methods for Evaluating Solid Waste, Physical-Chemical Methods" (SW-846) and analyzed for VOCs and SVOCs in accordance with NYSDEC State Protocols under EPA analytical Methods 8260 and 8270. The groundwater samples were placed in laboratory supplied glassware, packed in an ice-filled cooler accompanied by chain-of-custody documentation and picked up onsite by Phoenix Environmental Laboratories, Inc. and transported to their facility located at 587 East Middle Turnpike, Marchmont, CT 06040. See Appendix A for Laboratory Analytical Data Sheets.

The collected groundwater samples were compared against the NYSDEC's Technical & Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Groundwater Effluent Limitations (NYSDEC Groundwater Standards). A summary of the analytical results in the table overleaf.

Groundwater Measurement Parameters

As indicated in Table I on the following page, temperature levels ranged between 65.67°F through 67.07°F with an average temperature of 66.47°F. pH levels ranged between 7.91 through 7.97. Dissolved Oxygen levels ranged between 2.48 through 4.08 mg/l. Qualitative ORP levels ranged from -252.6 through -199.7.

Groundwater Analytical Result Interpretation

The subject site's baseline groundwater sampling event occurred on 5/31/2009 prior to the RegenOx™ application. Current analytical results compared to the NYSDEC Groundwater Standards are summarized below and shown within Table II on the following pages.

VOC contamination within monitoring wells MW-1 and MW-2 have been reduced by at least half, when compared against the previous sampling event, where contaminants are still detected above the groundwater standards although have significantly decreased. SVOC contaminants were not identified above the laboratory's minimum detection limit in either well.

Monitoring well MW-3 continues to remain with relatively unchanged VOC contaminant levels when compared against the previous two sampling events; where most of the identified VOCs exceed the groundwater standards. The SVOC contaminant Naphthalene, which was detected slightly above the standards during the previous sampling event, is currently reported at non-detect levels.

Monitoring well MW-4 was reported at levels consistent with the previous two sampling events, where VOC's 1,2,4-Trichlorobenzene, m,p-Xylene and o-Xylene were identified slightly exceeding the standards.

Conclusions

Gasoline related contamination remains present at the subject site from the past underground storage tanks as observed within the past subsurface investigation and groundwater sampling completed by CNS. Monitoring wells MW-1 and MW-2 have shown a significant decrease in contaminant levels although the identified VOC contaminants remain above the NYSDEC Groundwater Standards. Monitoring wells MW-3 and MW-4 were identified with little to no change in analytical results exceeding the standards.

As indicated in Table 1 the groundwater measurement parameters of temperature, pH, dissolved oxygen and oxygen-reduction potential (ORP) indicate favorable ranges for active oxidation and microorganisms, therefore CNS will continue to monitor the groundwater contaminant levels at the subject site. The next groundwater sampling event is scheduled for December of 2011.

Enclosed within this report are site drawings and laboratory analytical results. If you have any questions or require any additional information please call me at (516) 932-3228.

Re: Groundwater Sampling - December 2011
Site: 4650 Broadway, New York, NY 10040
NYSDEC Spill # 09-02240
CNS Job #: 820682

Dear Mr. Piper,

On Wednesday, December 28, 2011, CNS Management Corp. (CNS) collected groundwater samples from four (4) existing monitoring wells located at 4650 Broadway in New York, New York; referred to hereafter as the subject site. See Figure I: Site Location Map.

Background

Based on findings of a subsurface investigation, gasoline contamination was identified within the groundwater at the subject site. Based on these findings CNS completed and executed a NYSDEC approved Remedial Action Plan dated June 12, 2009 (NYSDEC RAP Approval Email dated July 10, 2009), bound under a separate cover, which consisted of the removal of Underground Storage Tanks (UST) and associated impacted soils, if applicable; and the installation of monitoring wells and utilizing RegenOx™ chemical oxidizer injections, to effectively remediate the groundwater. Note: prior to the RegenOx™ application, CNS collected a round of groundwater samples from each monitoring well to establish a site baseline. The previous rounds of quarterly sampling were performed on 9/30/2009, 12/29/2009, 3/29/2010, 6/28/2010, 9/30/2010, 12/30/2010, 3/29/2011, 6/28/2011 and 10/7/2011.

Upon completion of remediation, CNS submitted a Remediation Report (*Remediation Report* dated October 22, 2009 bound under a separate cover) and was subsequently directed by the NYSDEC to collect quarterly groundwater samples.

Field Activities

Groundwater samples were collected from the four (4) existing on-site monitoring wells labeled MW-1 through MW-4 (See Figure II: Monitoring Well Locations). Prior to collecting the groundwater samples, CNS measured the depth to groundwater from the top of the well casings utilizing an electronic Kock Water Level Meter.

Prior to sampling, the wells were purged of 3 to 5 well volumes utilizing a low flow submersible pump with disposable tubing. In addition, after the final well purge within each monitoring well, measurements for temperature, conductivity, pH, dissolved oxygen and oxygen-reduction potential (ORP) were

collected, utilizing a YSI 356 Multi Probe System within non-chemically analyzed clean sample jars. See Table I for Groundwater Measurements.

The collected groundwater samples were collected in accordance with USEPA, "Test Methods for Evaluating Solid Waste, Physical-Chemical Methods" (SW-846) and analyzed for VOCs and SVOCs in accordance with NYSDEC State Protocols under EPA analytical Methods 8260 and 8270. The groundwater samples were placed in laboratory supplied glassware, packed in an ice-filled cooler accompanied by chain-of-custody documentation and picked up onsite by Phoenix Environmental Laboratories, Inc. and transported to their facility located at 587 East Middle Turnpike, Marchmont, CT 06040. See Appendix A for Laboratory Analytical Data Sheets.

The collected groundwater samples were compared against the NYSDEC's Technical & Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Groundwater Effluent Limitations (NYSDEC Groundwater Standards). A summary of the analytical results in the table overleaf.

Groundwater Measurement Parameters

As indicated in Table I on the following page, temperature levels ranged between 52.62°F through 58.34°F with an average temperature of 56.09°F. pH levels ranged between 7.5 through 7.56. Dissolved Oxygen levels ranged between 3.25 through 5.25 mg/l. Qualitative ORP levels ranged from -145.5 through -123.0.

Groundwater Analytical Results Interpretation

The subject site's baseline groundwater sampling event occurred on 5/12/2009 prior to the RegenOx™ application. Current analytical results compared to the NYSDEC Groundwater Standards are summarized below and shown within Table II on the following pages.

VOC contamination within monitoring wells MW-1 and MW-2 has significantly increased, when compared against the previous sampling event, where constituent levels have almost doubled and continue to be detected above the groundwater standards. With exception to the SVOC Naphthalene within monitoring well MW-2, SVOC contaminants were not identified above standards.

Monitoring well MW-3 remains with little to no change in VOC contamination; where the VOC's identified above the laboratory's maximum detection limit exceed the groundwater standards. SVOC contamination remains below the NYSDEC Groundwater Standards.

There is also little to no change in contaminant levels identified within monitoring well MW-4 which has remained with the lowest contaminant levels since the baseline sampling event with only 1,2,4-Trinitrobenzene and m,p-Xylene detected slightly above the standards, with SVOC constituents at non-detect levels.

Table II: Groundwater Results Summary

Conclusions

Gasoline related contamination remains present at the subject site from the past underground storage tanks as observed within the past subsurface investigation and groundwater sampling completed by CNS. VOC contamination within monitoring wells MW-1 and MW-2 has increased since the previously sampling event, while monitoring wells MW-3 and MW-4 were identified with little to no change, although all monitoring wells continue to exceed the NYSDEC Groundwater Standards.

As indicated in Table 1, the groundwater measurement parameters of temperature, pH, dissolved oxygen and oxygen reduction potential (ORP) indicate favorable ranges for active oxidation and microorganisms, therefore CNS will continue to monitor the groundwater contaminant levels at the subject site. The next groundwater sampling event is scheduled for March of 2012.

Enclosed within this report are site drawings and laboratory analytical results. If you have any questions or require any additional information please call me at (516) 932-3228.

Laboratory Analytical Report w/ Chain of Custody

Tuesday, January 10, 2012

Attn: Mr. Charles Powers
CNS Management Corp
288 Newtown Road
Plainville, NY 11803-4307

Project ID: E28682
Sample IDs: 8816277 - 8816280

This laboratory is in compliance with the QA/QC procedures outlined in EPA 800/4-79-019, Handbook for Analytical Quality in Water and Waste Water, March 1979, SW846 QA/QC and MELAC requirements of procedures used.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

A handwritten signature in black ink, appearing to read "Piyika Shiller".

EXECUTIVE SUMMARY

Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C. (Langan) was retained by Washington Square Partners, Inc. (the "User") to prepare this Phase I Environmental Site Assessment (ESA) for the property located at 4650 Broadway (Block 2175, Lot 1) in New York, New York (the "Subject Property"). The User is a consultant for Acadia Sherman Avenue, LLC, the owner of the Subject Property. The Subject Property occupies an area of approximately 47,175 square feet and is located at the northeast side of the intersection of Broadway and Sherman Avenue (Sherman Plaza). The Subject Property is bound by a five-story mixed-use commercial and residential building to the north; two multi-story residential buildings to the east; Sherman Avenue to the south; and Broadway, followed by Fort Tryon Park, to the west. A two-story commercial building with one cellar level (constructed in 1928) occupies the Subject Property. The building spans the entire footprint of the property and is used partly as a parking garage with some vacant areas on each floor. This Phase I ESA was performed to satisfy City Environmental Quality Review (CEQR) requirement as part of a proposed rezoning of the Subject Property.

This Phase I ESA was conducted in accordance with the American Society for Testing Materials (ASTM) Practice E1527-13 (Standard Practice for ESA: Phase I ESA Process), which also satisfies the United States Environmental Protection Agency's (USEPA) All Appropriate Inquiry (AAI) Rule needed to qualify for the bona fide prospective purchaser liability protections available under the Comprehensive Environmental Response Compensation and Liability Act (CERCLA). The objective of this Phase I ESA was to identify the presence or likely presence, use, or release on the Subject Properties of hazardous substances or petroleum products as defined in ASTM E1527-13 as a recognized environmental condition (REC). Releases of volatile organic compounds to the subsurface may result in vapor intrusion into existing or future buildings.

The Phase I ESA identified the following RECs and HRECs:

REC 1- Petroleum Bulk Storage, Historic Fueling and Service Station Use and Open Spill on the Subject Property

A New York State (NYS) Petroleum Bulk Storage (PBS) listing indicated a 2,500 gallon underground storage tank (UST) and a 5,000-gallon UST, each containing No. 2 fuel oil, were closed and removed from the Subject Property in 1998 and a 5,000-gallon No. 4 oil aboveground storage tank (AST) and three 550-gallon gasoline USTs were closed and removed from the Subject Property in 2009. The New York City Department of Buildings classified the Subject Property as G1-Garage/Gas Station and historical Sanborn maps indicated the property was used as a service station and garage. During the 2009 UST

removals, petroleum impacts were observed in soil and groundwater, a spill was reported to the New York State Department of Environmental Conservation (NYSDEC), and spill number 0902240 was assigned.

A review of previous environmental reports revealed that remedial action was undertaken in 2009 to address the spill. After the USTs were decommissioned and removed, petroleum-impacted soil was removed and a RegenOx[®] (chemical oxidant) injection was performed to treat impacted groundwater. The remedial excavation and Regeonx[®] injections were focused in the former tank areas proximate to the basement boiler room. Groundwater was monitored for two years following the remedial action; analytical results did not show contaminant reductions that satisfied NYSDEC and the spill remains open.

REC 2 – Historical Use, Open Spill and Petroleum Bulk Storage on Adjoining and Surrounding Properties

Around 1935, a gasoline filling station was located at 4706 Broadway, approximately 250 feet north (cross-gradient with respect to anticipated groundwater flow direction) of the Subject Property. Around 1927, a manufacturing facility was located at 1 Sherman Avenue (also identified as 107-119 Ellwood Street), a southern adjoining property across Sherman Avenue.

NYSDEC Spill No. 0809967 is associated with 1 Sherman Avenue. The spill was closed on November 22, 2013; however, the database listing indicates that impacted soil is still present on the site; no information related to groundwater sampling was available for review. In addition, the property is listed on the PBS database (Facility ID 2-189472). There is one 4,500-gallon AST listed as “in service.”

Historic RECs and De Minimis Concerns

A closed spill (NYSDEC Spill No. 0604479), related to a tank overfill on the sidewalk at the Subject Property, is considered a Historic REC (HREC). The incident was contained, cleaned up, and closed by the NYSDEC within one day.

Automobile staining on the basement floor is a de minimis concern as the concrete floor in these areas appeared to be in good condition. There are floor drains throughout the building; however none had petroleum staining around them. Storage of 55-gallon drums in the basement is a de minimis concern as the drums do not appear to be leaking.

Additional information related to RECs, HRECs, and de minimis concerns can be found in the body of this report.

1.0 INTRODUCTION

Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C. (Langan) was retained by Washington Square Partners, Inc. (the "User") to prepare this Phase I Environmental Site Assessment (ESA) for the property located at 4650 Broadway (Block 2175, Lot 1) in New York, New York (the "Subject Property"). The User is a consultant for Acadia Sherman Avenue, LLC, the owner of the Subject Property. The location of the Subject Property is shown on Figure 1. The Subject Property occupies an area of approximately 47,175 square feet and is located at the northeast side of the intersection of Broadway and Sherman Avenue (Sherman Plaza). The Subject Property is bound by a five-story mixed-use commercial and residential building to the north; two multi-story residential buildings to the east; Sherman Avenue to the south; and Broadway, followed by Fort Tryon Park, to the west. A two-story commercial building with one cellar level (constructed in 1928) occupies the Subject Property. The building spans the entire footprint of the property and is used partly as a parking garage with some vacant areas on each floor. This Phase I ESA was performed to satisfy City Environmental Quality Review (CEQR) requirement as part of a proposed rezoning of the Subject Property.

1.1 Purpose of the Phase I ESA

The purpose of this Phase I ESA is to accomplish the following:

(1) Identify Recognized Environmental Conditions (RECs) in connection with the Subject Property, as defined in The Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process, Designation E1527-13, which states: The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

(2) Satisfy the criteria of United States Environmental Protection Agency (USEPA) 40 Code of Federal Regulations (CFR) Part 312 Subpart C Standards and Practices §312.20 AAI Rule.

1.2 Scope of the Phase I ESA

This Phase I ESA was conducted utilizing a standard of good commercial and customary practice that is consistent with American Society for Testing and Materials (ASTM) E1527-13. Any significant scope-of-work additions, deletions, or deviations to ASTM E1527-13 are noted in Section 8.0 of this report. In general, the scope of this assessment consisted of obtaining information from the Owner; reviewing reasonably ascertainable information and environmental data relating to the Subject Property; reviewing maps and records maintained by federal, state, and local regulatory agencies; interviewing persons knowledgeable about the Subject Property; and conducting a site inspection. The specific scope of this assessment included the following:

1. A site reconnaissance to characterize conditions and assess the Subject Property's location with respect to adjoining and surrounding property uses and natural surface features. The reconnaissance included the surrounding roads and observations of surrounding properties from public rights-of-way to identify obvious potential environmental conditions on neighboring properties. The site reconnaissance was conducted in a systematic manner focusing on the spatial extent of the Subject Property and then progressing to adjacent and surrounding properties. Photographs taken as part of the site reconnaissance are provided in Appendix A.
2. As per ASTM E1527-13, questionnaires were provided to the Owner to obtain information related to the Subject Property. Copies of the completed questionnaires are provided in Appendix B.
3. A review of previous environmental reports for the Subject Property, provided by the Owner. Copies of the reports are included in Appendix C.
4. A review of environmental databases maintained by the United States Environmental Protection Agency (USEPA), state, and local agencies within the approximate minimum search distance. Environmental Data Resources, Inc. (EDR) prepared the environmental database report, which is included in Appendix D.
5. Freedom of Information Act (FOIA) requests were sent to federal, state, and local agencies. As of the date of this report, FOIA responses were not received. Any FOIA responses received that alter the conclusions made in this report will be documented in an addendum to this report. Copies of the FOIA requests and responses received to-date are included in Appendix E.

6. New York City Department of Buildings (NYCDOB) records and a Planning Commission Zoning Map were reviewed. Available NYCDOB records and Zoning Map are included in Appendices F and G, respectively.
7. Physical characteristics of the Subject Property were determined through referenced sources for topographic, geologic, soils, and hydrologic data.
8. A review and interpretation of aerial photographs, Sanborn Fire Insurance Maps (Sanborn Maps), historical topographic maps, and city directories to identify previous activities on and in the vicinity of the Subject Property. Copies are included in Appendices H, I, J, and K respectively.
9. A review of an Environmental Lien search for the Subject Property. A copy of the environmental lien search report is included in Appendix L.
10. A review of published radon occurrence maps to determine if the Subject Property is located in an area with a propensity for elevated radon levels.

1.3 Assumptions, Limitations, and Exceptions

This Phase I ESA report was prepared for Washington Square Partners, Inc. for the Subject Property located at 4650 Broadway (Block 2175, Lot 1), in New York, New York. The report is intended to be used in its entirety. Excerpts taken from this report are not necessarily representative of the assessment findings. Langan cannot assume responsibility for use of this report for any property other than the Subject Property addressed herein, or by any other third party without a written authorization from Langan.

Langan's scope of services, which is described in Section 1.2, was limited to that agreed to with the User and no other services beyond those explicitly stated are implied. The services performed and agreed upon for this effort comports to those prescribed in the ASTM Standard E1527-13. Intrusive sampling (e.g., soil borings and groundwater sampling) was not performed as part of this Phase I ESA.

This Phase I ESA was not intended to be a definitive investigation of possible environmental impacts at the Subject Property. The purpose of this investigation was limited to determining if there is reason to suspect the possibility of RECs at the Subject Property. It should be understood that even the most comprehensive Phase I ESA may fail to detect environmental liabilities at a particular Subject Property. Therefore, Langan cannot "insure" or "certify" that the Subject Property is free of environmental impacts. No expressed or implied representation or warranty is included or intended in this report, except that our services were performed, within

the limits prescribed by our client, with the customary standard of care exercised by professionals performing similar services under similar circumstances within the same jurisdiction.

The conclusions, opinions, and recommendations provided in this report are based solely on the specific activities as required for the performance of ASTM E1527-13 and are intended exclusively for the purpose stated herein, at the specified Subject Property as it existed at the time of our site visit.

2.0 SUBJECT PROPERTY DESCRIPTION

2.1 Location and Description

The Subject Property is located in the Washington Heights area of the Borough of Manhattan, New York and is bound by a five-story mixed-use commercial and residential building to the north; two multi-story residential buildings to the east; Sherman Avenue to the south; and Broadway, followed by Fort Tryon Park to the west. The Subject Property occupies an area of approximately 47,175 square feet on the northeast side of the triangular intersection of Broadway and Sherman Ave (Sherman Plaza). A two-story commercial building spans the entire footprint of the Subject Property. According to the United States Geological Survey (USGS) Central Park Quadrangle 7.5-minute Series Topographic Map, the Subject Property sits at an elevation of approximately 40 feet above mean sea level (msl). The topography of the Subject Property and surrounding area slopes east. Photographs showing the current condition of the Subject Property are provided in Appendix A.

Based on visual observations of the surrounding area made during the site reconnaissance, the Subject Property is located in an urban area primarily characterized by multi-story residential and commercial buildings. Surrounding Property usage is summarized in the following table:

Direction	Adjoining Properties	Surrounding Properties
North	Five-story mixed-use commercial and residential building (4672 Broadway)	Multiple-story residential and commercial buildings
East	Five-story residential building (19 Dongan Place) and a six-story mixed use residential and commercial building (20 Sherman Avenue)	Multiple-story residential and commercial buildings
South	Sherman Avenue followed by multiple-story mixed use commercial and residential buildings	Multiple-story residential and commercial buildings
West	Broadway followed by Fort Tryon Park	Park followed by the Hudson River

2.2 Description of Subject Property Improvements

Improvements at the Subject Property are summarized in the following table:

Site Improvements	
Size of the Subject Property	Approximately 47,175 square feet
Buildings/Spaces/Structures	Two-story concrete and concrete masonry unit (CMU) building with a full basement.
Unimproved Areas	None
Surface Water	None
Potable Water Source	New York City
Sanitary and Storm Sewer Utilities	New York City
Electrical Utilities	Consolidated Edison Company of New York, Inc.
Construction Completion Date	Circa 1928
General Construction Type	Concrete and CMU with flat roof
Cooling and Ventilation System Type	Ceiling mounted air conditioning ventilation units (inactive) throughout garage structure; offices use electric air conditioning
Heating System Type	Offices use electric heat and air conditioning. Out-of-service ceiling vents and an inactive basement boiler system were observed.
Emergency Power	None identified

2.3 Title Records

Langan researched ownership records for the Subject Property at www.nyc.gov. The New York City Department of Finance – Office of the City Register listed Acadia-P/A Sherman Avenue, LLC as the current owner. The following table provides available deed information for the Subject Property:

Date Filed	Document Type	Party 1	Party 2
10/8/2009	UCC3 Termination	Acadia-P/A Sherman Avenue, LLC	Bank of America, N.A.
10/8/2009	Satisfaction of Mortgage	Acadia-P/A Sherman Avenue, LLC	Bank of America, N.A.

Langan's review of ownership records did not indicate any ownership-related RECs at the Subject Property.

3.0 OWNER PROVIDED INFORMATION

3.1 User and Owner/Operator Questionnaires

Tom Julius, of Acadia Sherman Avenue, LLC, completed a User Questionnaire and Gary Spindler, of Park It! Management, completed an operator questionnaire. Neither Mr. Julius nor Mr. Spindler is aware of any environmental cleanup liens, land use limitations, environmental cleanups, or environmental assessment reports associated with the Subject Property. The completed owner and operator questionnaires are included in Appendix B.

3.2 Previous Environmental Reports

Langan received the several previous environmental reports from the property owner. A summary of these reports is provided below, and copies are provided in Appendix C.

Phase I ESA, prepared by Soil Mechanics Environmental Services, dated February 2003

The Phase I was completed on behalf of Murray Hill Properties to evaluate site conditions, the presence of contamination, possible contamination sources, and potential environmental impairments at the Subject Property. Key findings are listed below.

- Prior to 1960 the building was used for automobile sales.
- The building was heated by a fuel oil boiler system.
- A concrete-encased 5,000-gallon aboveground storage tank (AST) within an empty containment dike was installed in 1998. New York State Department of Environmental Conservation (NYSDEC) and Fire Department of New York (FDNY) records indicated a 5,000-gallon and a 2,500-gallon underground storage tank (UST) were associated with the property. Documentation obtained from the Bermont Operating Corp indicated that three 550-gallon gasoline USTs were abandoned in-place (filled with concrete) in 1983. Building Dept. records included permits to install two gasoline tanks (one in 1934 and one in 1941) and permits to replace a 5,000-gallon and 2,500 gallon tanks with a 5,000-gallon tank in 1998.
- There was petroleum staining on floors.
- A review of surrounding properties revealed a dry cleaner in close proximity to the Subject Property.

Asbestos Survey Report, prepared by CNS Management Corp, dated January 24, 2005

This survey identified the following asbestos containing materials (ACM) present within the on-property structure: cooling tower fill, duct and wall tar, asphalt roof membrane, 2-foot by 4-foot ceiling tiles, pipe insulation, 1-foot by 1-foot vinyl floor tiles and spray-on fireproofing.

2005 Limited Phase II Subsurface Investigation, prepared by CNS Management Corp. dated April 21, 2005

This Phase II report was prepared for Acadia Realty Trust, the owner at the time of the report, to comply with NYSDEC Spill Guidance Manual. CNS advanced five soil borings to 3 to 15 feet below grade surface (bgs) around the boiler room and collected soil samples for analysis of volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs). Several VOCs, commonly associated with petroleum contamination, were identified in soil east (down-gradient with respect to presumed groundwater flow direction) of the boiler room at concentrations above the contemporary standards (Technical and Administrative Guidance Manual [TAGM]). CNS concluded that soil impacts were related to gasoline range organics and recommended the three USTs (previously closed in place) be located with ground penetrating radar to evaluate if they are the source of the impacts.

Letter from Peter Brighton (CNS) to Robert Scholem (Acadia Realty Trust), Dated September 28, 2005

This letter transmitted a NYSDEC Petroleum Bulk Storage (PBS) registration for one 5,000-gallon AST and described typical inspections to be conducted for the tank. The letter also stated that to remove FDNY violations related to PBS tanks, an affidavit regarding the previous tank removals should be provided to the FDNY.

Asbestos Operations and Maintenance Manual, prepared by CNS Management Corp., dated October 1, 2005

This manual outlines work practices to avoid exposure to ACM, regulatory and employee notification systems, and emergency exposure procedures.

Asbestos Abatement Specification, prepared by CNS Management Corp., dated November 2, 2007

The specification outlines the abatement contractor bidding procedure, a summary of ACM in the building and details the necessary procedures for containment and proper removal of ACM.

Air Monitoring Compliance Report, prepared by CNS Management Corp., dated May 14, 2009

This report details the procedures followed during a multi-phase ACM removal conducted by Delta Environmental in March and April of 2009. CNS conducted daily air monitoring and site inspections and collected air samples. The removal project was completed in compliance with New York City Department of Environmental Protection (NYCDEP) Title 15 Chapter 1 asbestos regulations. The ACM abatement included removal of the following:

- 1,260 square feet (sq ft) of boiler insulation;
- 6,510 linear feet of pipe insulation;
- 88,252 sq ft of floor tiles;
- 4,264 sq ft of spray-applied fire proofing; and
- 122 sq ft of cooling tower fill.

The site inspection for this report identified vinyl floor tiles and ceiling tiles in the first floor offices which may contain asbestos.

Remedial Action Plan, prepared by CNS Management Corp., dated June 12, 2009

This Remedial Action Plan (RAP) was submitted to NYSDEC on behalf of Acadia P/A/ Sherman Avenue, LLC for the remediation of NYSDEC Spill No. 0902240. The RAP included a summary of soil and groundwater samples collected between March 30 and April 1, 2009; these samples were collected after removing the three gasoline USTs. Photoionization detector (PID) screening of soil resulted in readings of up to 1,153 parts per million (ppm). Analytical results revealed several VOCs in soil and groundwater above state standards.

CNS proposed the following remedial actions:

- Removal and closure of USTs in accordance with applicable regulations;
- Field screening of soils during removal;
- Stockpiling of petroleum-impacted soil;
- Endpoints sampling of soil;
- Off-site disposal of impacted soil;
- RegenOx® chemical application, by injection, to remediate impacted groundwater; and
- Groundwater monitoring to determine effectiveness of remedy.

Remediation Report, prepared by CNS Management Corp., dated October 22, 2009

CNS presented a Remedial Report (RR) to NYSDEC on behalf of Acadia P/A/ Sherman Avenue, LLC. The RR detailed implementation of the June 2009 RAP. The remediation described the following:

- Three 550-gallon USTs and associated piping were removed from the Subject Property. PBS registration was updated to reflect their removal;
- Petroleum-impacted soil was removed from the Subject Property;
- Endpoint soil samples were collected and results indicated that VOC concentrations were below state standards; and
- RegenOx® was injected into groundwater on the Subject Property, and subsequent groundwater samples showed an initial reduction of VOC and SVOC compounds in groundwater in three of four wells sampled. Levels gradually rose following the initial reduction.

CNS requested that no further action be required for soil and recommended continuing groundwater monitoring until quarter four of 2009.

Groundwater Monitoring Reports for December 2009 – December 2011, prepared by CNS Management Corp

CNS submitted a total of eight quarterly Groundwater Monitoring Reports between December 2009 and December 2011. The reports detail the collection of groundwater samples from four existing site wells and analysis for VOCs and SVOCs. Analytical results showed an initial reduction from baseline levels (prior to injections), but no trend of continuing reduction. In fact, VOCs were observed to increase, in monitoring well MW-4 (southeast/down-gradient with respect to presumed groundwater flow direction) of the boiler room beginning in June 2010, where concentrations were either non-detect or below standards in the baseline sample but above the standards during the three subsequent quarters of sampling. In the October 20011 report, CNS stated that the next sampling event would be in December 2011.

Conclusions Based on Review of Previous Reports

Petroleum bulk storage at the Subject Property and related open spill (No. 09-02240) are considered a REC. Based on the most recent groundwater sample results, the 2009 remedy does not appear to have been effective in remediating groundwater and results from monitoring well MW-4 indicate impacts may be migrating further down-gradient. In addition, reports conclude that all USTs have been removed, but based on groundwater analytical data it is possible that USTs remain.

4.0 RECORDS REVIEW

4.1 Environmental Records

A copy of regulatory database information was provided by EDR and is included in Appendix D. The EDR report is a listing of sites identified on select federal and state standard source environmental databases within the approximate search radius specified by ASTM Standard Practice for E1527-13. Langan reviewed each environmental database on a record-by-record basis to determine if certain sites identified in the report are suspected to represent a potential impact to the Subject Property. Langan also reviewed "Orphan Sites" listed within the report. Orphan sites are those Sites that could not be mapped due to inadequate address information. No Orphan sites were identified by Langan within the ASTM search radii, either during the Subject Property reconnaissance or by cross-referencing to mapped listings. All distances to adjacent properties are measured from the perimeter of the Subject Property.

The following table lists the number of sites by database within the prescribed search radius appearing in the EDR Report.

Database Record Summary			
Database Reviewed (Date of government version)	Minimum Search Area	Subject Property listed	Number of Sites Within Minimum Search Area
USEPA DATABASES			
National Priorities List (NPL) (10/25/2013)	1 Mile Radius	No	1
Delisted NPL (10/25/2013)	1/2 Mile Radius	No	0
Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) and CERCLIS No Further Remediation Action Planned (NFRAP) (10/25/2013)	1/2 Mile Radius	No	1
Resource Conservation and Recovery Act (RCRA) Corrective Reports (CORRACTS) (9/10/2013)	1 Mile Radius	No	0
RCRA Treatment, Storage, and Disposal Facilities (TSDf) (9/10/2013)	1/2 Mile Radius	No	0
RCRA Generators (9/10/2013)	Subject Property and Adjoining	No	2
Facility Information System (FINDS) Database (3/8/2013)	Subject Property	No	0
Environmental Response Notification System (ERNS) (9/30/2013)	Subject Property	No	0
Engineering Controls (EC) Site Lists (12/17/2013)	Subject	No	0

Database Record Summary			
Database Reviewed (Date of government version)	Minimum Search Area	Subject Property listed	Number of Sites Within Minimum Search Area
	Property

NA Not Applicable; databases with a "Not Applicable" Minimum Search Radius are databases reviewed as part of the Phase I ESA but not required as per ASTM E1527-13.

A description of the reviewed databases is provided in the EDR Report (Appendix D). A summary of Subject Property database listings and other sites identified within the prescribed search area is presented below.

4.1.1 Federal Agency Database Findings

The Subject Property and/or sites within their respective minimum search distances as specified by ASTM E1527-13, were not listed in the following Federal Agency databases: Delisted NPL, CERCLIS-NFRAP, RCRA CORRACTS, RCRA TSDF, FINDS, ERNS, EC, or IC.

The following summary describes the sites that were identified within the designated search radii:

NPL Database

The NPL database identifies sites for priority cleanup under the Superfund Program. The Site was not listed in the NPL database, but the Hudson River PCBs Cleanup was included. Although a 200-mile section of the Hudson River is included as part of the Superfund Site, the dredging work is focused north of Albany, New York. Based on the nature of this NPL listing, it is not considered a REC.

CERCLIS NFRAP Database

The CERCLIS list is a compilation of known and suspected uncontrolled or abandoned hazardous waste sites, which are, or were, under investigation by USEPA but have not been elevated to the status of a Superfund (NPL) site. Former CERCLIS sites that have been granted the status of NFRAP are also included in this database. The Subject Property was not listed in the CERCLIS or CERCLIS-NFRAP database; however, one CERCLIS site was identified within the search criteria. The Hudson River PCBs Cleanup was identified as a CERCLIS site. As discussed above, the Hudson River PCB cleanup is not a REC.

RCRA Generators

The RCRA Info database is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous Waste Amendments (HSWA) of 1984. The database includes selective information on sites that generate, transport, store, treat and/or dispose of hazardous waste as defined by the RCRA. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste or over 1 kg of acutely hazardous waste per month; small quantity generators (SQGs)

generate between 100 kg and 1,000 kg of hazardous waste per month; conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste or less than 1 kg of acutely hazardous waste per month, and RCRA Non-Gen, or former hazardous waste generators no longer generate hazardous waste. The Subject Property was not listed in the RCRA Generator database; however, two adjoining properties were included and are discussed below:

Site Name: Con Edison

Site Address: 4670 Broadway and Dongan Street

Location: This site adjoins the Subject Property to the north.

Description: This facility was listed as a CESQG in 2009. Waste type was not specified and no violations were reported.

Site Name: Con Edison Manhole 28153

Site Address: Broadway and Dongan Street

Location: This site adjoins the Subject Property to the north.

Description: This facility was listed as a CESQG in 2011. Waste type was not specified and no violations were reported.

Based on the lack of violations, these RCRA CESQGs are not considered a REC.

4.1.2 State Agency Database Findings

The Subject Property and sites within the respective minimum search distances as specified by ASTM E1527-13 were not listed in the following State Agency databases: HSWDS, SWF, EC, IC, CBS or MOSF. The following summary describes the sites that were identified within the designated search radii:

SHWS Database

The SHWS database is a comprehensive listing of inactive hazardous waste sites that are the state's equivalent to CERCLIS. The Subject Property was not listed in the SHWS database; however, one site, NYCDGS – PUBLIC SCHOOL IS 229X, was identified within the minimum search distance. This SHWS site is located cross-gradient and more than 4,150 feet from the Subject Property; therefore, it is not considered a REC.

Leaking Underground Storage Tanks Database

The LTANKS database contains an inventory of reported leaking storage tank incidents, including leaking USTs and ASTs. As per ASTM E1527-13, the approximate minimum search

distance required for LTANK incidents is within ½ mile of the Subject Property. The Subject Property (identified as “at Dykman St” – 4660 Broadway) was listed in the LTANKS database. The incident was reported on March 28, 2002 and was given spill number 0112246. The spill was the result of a tank overfill from the sidewalk fill port. The spill was cleaned to the satisfaction of NYSDEC and the spill number was closed on March 29, 2002. This incident is considered an HREC.

Sixty-one other LTANK incidents were also identified within a ½-mile radius of the Subject Property. Fifty-nine of these incidents have been closed by the NYSDEC and the two open spills are either located more than 300 feet down-gradient or more than 2,500 feet cross-gradient from the Subject Property. Based on the regulatory status, distance from the Subject Property, and/or cross- or down-gradient location, the off-site LTANK incidents are not considered RECs.

Spills Database

The Spills database, maintained and updated by NYSDEC, is an inventory of sites where spills have been identified and reported to the NYSDEC. The Subject Property was listed in the Spills database in relation to Spill No. 0902240, which was reported on May 26, 2009 when three 550-gallon USTs were discovered at the Subject Property. Laboratory analysis of soil and groundwater samples indicate that the soil was “heavily contaminated.” The report further states that “cleanup is pending,” and the spill was not closed. An open spill on site with documented impacts to soil and groundwater is considered a REC. The spill may have also adversely impacted soil vapor. Further information regarding Spill No. 0902240 is presented in Section 3.2 of this report.

In addition to the reported spill on the Subject Property, 28 spill incidents were identified at surrounding properties within 1/8 mile of the Subject Property. Based on the EDR report, 26 of the 28 incidents were closed. Based on further research on the NYSDEC website, we concluded that the remaining two spills (No. 0809967 and No. 1304645) have also been closed. Spill no. 0809967 was a No. 2 fuel oil spill that occurred at 107-119 Ellwood Street (also known as 1 Sherman Ave), which adjoins the Subject property. The spill was closed on November 22, 2013; however, EDR report only included information on spills up to November 19, 2013. The most recent information included in the EDR report indicated that, as of October 2009, soil at this location contained petroleum-related VOCs at concentrations above relative standards and groundwater data was not provided. This closed spill is considered a REC because no information related to groundwater sampling was available for review and the potential for impacts to groundwater or soil vapor at the Subject Property from this spill could not be ruled out.

Voluntary Cleanup Program Sites

The VCP database lists Voluntary Cleanup Agreements associated with a State voluntary remedial program that uses private monies to get contaminated sites remediated to levels allowing for the sites' productive use. One site was identified within the minimum search criteria of ½-mile of the Subject Property. CE-Broadway/Dyckman Street Station Site at 12 Dongan Place is approximately 100 feet north (cross-gradient) of the Subject Property. This location was formerly occupied by a large gas holding facility. During the investigation phase, no significant MGP impacts were identified and the NYSDEC issued a No Further Action letter and a Covenant not to Sue. Based on information contained in the database listing and the regulatory status, this VCP is not considered a REC.

Brownfield Sites

A Brownfield is any real property where re-development or re-use may be complicated by the presence or potential presence of a hazardous waste, petroleum product, pollutant, or contaminant. The Subject Property was not listed as a Brownfield site; however, two brownfield sites (one state and one federal) were identified within 1/2 mile of the Subject Property. The listed brownfield sites are located more than 1,000 feet from the Subject Property at a cross-gradient locations with respect to presumed groundwater flow direction and are not considered RECs.

Petroleum Bulk Storage Facilities UST and AST Databases

The PBS database is a listing of USTs and ASTs registered with the NYSDEC. The minimum search radius for PBS facilities includes the Subject Property and adjoining properties. The Subject Property was listed in the database. The PBS Registration number is 2-077666, and it is currently listed as "unregulated." The registration lists the following tanks in association with the Subject Property:

Tank No.	Capacity (gallons)	UST or AST	Contents	Status
001	5,000	UST	No. 2 Fuel Oil	Closed-Removed 9/1/1998
002	2,500	UST	No. 2 Fuel Oil	Closed-Removed 9/1/1998
003	5,000	AST	No. 4 Fuel Oil	Closed-Removed 8/7/2009
004	550	UST	Gasoline	Closed-Removed 8/7/2009
005	550	UST	Gasoline	Closed-Removed 8/7/2009
006	550	UST	Gasoline	Closed-Removed 8/7/2009

As there is an open spill at the Subject Property related to USTs, former petroleum bulk storage at the site is a REC.

Five adjoining properties were also listed as PBS facilities and are discussed below and are discussed below:

Site Name: 19 DONGAN PLACE

Site Address: 19 Dongan Place (PBS Facility ID No. 2-153729)

Location: This site adjoins the Subject Property to the east.

Description: A 5,000-gallon UST containing No. 6 fuel oil was installed in January 1946 and is listed as "in service." The UST was noted to be within a vault and no violations were reported. As there are no open spills or LTANK listings for this site, it is not considered a REC.

Site Name: 4672 BROADWAY

Site Address: 4672 Broadway (PBS Facility ID No. 2-612077)

Location: This site adjoins the Subject Property to the north.

Description: A 5,000-gallon AST containing No. 6 fuel oil was installed in November 1924 and is listed as "in service." The AST was noted to be within a vault and no violations were reported. As there were no violations and this location is not associated with an open spill or LTANK incident, this PBS facility is not considered a REC.

Site Name: 9 – 21 SHERMAN AVE

Site Address: 9 – 21 Sherman Ave (PBS Facility ID No. 2-334499)

Location: This site adjoins the Subject Property to the south across Sherman Avenue.

Description: A 5,000-gallon AST containing No. 4 fuel oil was installed in November 1924, has no noted secondary containment, and is listed as "in service." As there were no violations and this location is not associated with an open spill or LTANK incident, this PBS facility is not considered a REC.

Site Name: 20 SHERMAN AVE

Site Address: 20 Sherman Ave (PBS Facility ID No. 2-234626)

Location: This site adjoins the Subject Property to the east.

Description: A 5,000-gallon AST containing No. 2 fuel oil was installed in February 1999 and is listed as "in service." The AST was noted to be within diking and no violations were reported. As there were no violations and this location is not associated with an open spill or LTANK incident, this PBS facility is not considered a REC.

Site Name: GATEWAY VENTURES, LLC

Site Address: 1 Sherman Ave/107-119 Ellwood Street (PBS Facility ID No. 2-611123)

Location: This site adjoins the Subject Property to the south across Sherman Avenue.

Description: A 3,000-gallon AST containing No. 2 fuel oil was removed in July 2009 and is listed as “closed/removed.” The AST was noted to be within a vault and no violations were reported. This location is also associated with Spill No. 0809967 and is considered a REC.

4.1.3 Other Database Findings

Manufactured Gas Plant Sites

The MGP sites database is a proprietary database that includes records of manufactured coal gas plants compiled by EDR. The Subject Property was not listed in the MGP database; however, two MGP sites were identified within 1 mile. One facility is located approximately 1 mile from the Subject Property at down-gradient location and is not considered a REC. The second site Con Edison – Broadway/Dyckman is located at 12 Dongan Place, approximately 100 feet from the Subject Property. This facility is discussed above under VCP sites and is not considered a REC as it was investigated and no significant impacts were found.

4.1.4 Local Regulatory Agency Findings

Freedom of Information Act Requests

FOIA requests were submitted to the following federal, state, and local agencies via written correspondence on March 31, 2014:

- New York City Department of Environmental Protection (NYCDEP);
- New York City Department of Health (NYCDOH);
- New York City Fire Department (FDNY);
- New York State Department of Health (NYSDOH);
- NYSDEC; and
- USEPA, Region 2.

Complete responses to the FOIA requests have not yet been received. Copies of the FOIA requests and any responses received are included in Appendix E. Should pending responses alter the conclusions provided within this report, we will issue the modified conclusions as an addendum.

New York City Department of Buildings

Langan conducted a records search through the NYCDOB online query system on April 3, 2014 for 4650 Broadway. Copies of reviewed NYCDOB records are provided in Appendix F. The records search identified one building on the Lot. The Department of Finance building classification for the Subject Property is G1-GARAGE/GAS STAT'N. Classification of the Subject Property as a garage/gas station is a REC.

There were 22 Environmental Control Board (ECB) violations between 1992 and 2012, 7 of which were listed as "open." A description of the active violations is provided below:

- 34932152K – Working without a permit (issued 8/20/2012);
- 38108093J – Failure to maintain the elevator (issued 10/3/2000);
- 34244043M – Failure to maintain building (issued 3/22/2000);
- 38223839K – Failure to maintain building up to code (issued 10/12/2012);
- 38228661P – Failure to maintain the elevator (issued 9/24/2012);
- 34986753J – Failure to comply with vacate order (issued 8/16/2012); and
- 34932151Z – Failure to update sprinkler system (issued 8/20/2012).

Due to the nature of these violations they are not considered a REC.

Certificate of Occupancy records were available for 1927 to 1969 and indicated building use for automobile sales and distribution, automobile service, a garage, a bowling alley, a bar and restaurant and the NYC Welfare Office. The certificate dated May 24, 1951 limits oil and gasoline sales "to be confined to building" and indicates that a fuel oil tank was installed on March 15, 1951. The certificate dated April 19, 1956 indicates that a fuel oil tank installation was approved by the FDNY on January 2, 1956. Use of the Subject Property for sales of oil and gasoline and fuel storage is a REC.

New York City Planning Commission Zoning Department

According to the New York City Planning Commission (NYCPC) Zoning Map 3a, dated September 8, 1988, the Subject Property is located within a R7-2 residential district with a partial C2-4 commercial overlay. "R7 districts are medium-density apartment house districts mapped in much of the Bronx as well as the Upper West Side in Manhattan and Brighton Beach in Brooklyn," according to the New York City Department of City Planning website. The Subject Property has a C2-4 overlay, which is a "commercial overlay mapped within residence districts. Mapped along streets that serve local retail needs." A copy of the zoning map is provided in Appendix G.

4.2 Physical Setting Sources

4.2.1 Topography

According to the United States Geological Survey (USGS) Central Park Quadrangle 7.5-minute Series Topographic Map, the Subject Property sits at an elevation of approximately 40 feet above mean sea level (msl). The topography of the Subject Property and surrounding area slopes east. Properties east of the Subject Property are considered down-gradient with respect to presumed groundwater flow direction, and properties west of the Subject Property are considered up-gradient with respect to presumed groundwater flow direction.

4.2.2 Geology

Geological surface features (e.g., rock outcroppings) were not observed on the Subject Property; however, there is a large hill (within Fort Tryon Park) located directly to the west. Soil and bedrock stratigraphy throughout Manhattan typically consists of a layer of historical fill that overlies glacial till, decomposed unconsolidated bedrock, and bedrock. Based on a review of the "Bedrock and Engineering Geologic Maps of New York County and parts of Kings and Queens Counties, New York, and Parts of Bergen and Hudson Counties, New Jersey" (Baskerville Map), dated 1994 and prepared by Charles A. Baskerville, the Site is underlain by the lower Ordovician to Cambrian Inwood Marble bedrock, which consists of four interbedded units of white to bluish-grey calcitic and dolomitic marble.

The Baskerville Map indicates that bedrock in the vicinity of the Site is located approximately 20 feet below sidewalk grade (about 8-10 feet below the basement).

4.2.3 Hydrology

Groundwater flow is typically topographically influenced, as shallow groundwater tends to originate in areas of topographic highs and flows toward areas of topographic lows, such as rivers, stream valleys, ponds, and wetlands. A broader, interconnected hydrogeologic network often governs groundwater flow at depth or in the bedrock aquifer. Groundwater depth and flow direction are also subject to hydrogeologic and anthropogenic variables such as precipitation, evaporation, extent of vegetation cover, and coverage by impervious surfaces. Other factors influencing groundwater include depth to bedrock, the presence of artificial fill, and variability in local geology and groundwater sources or sinks.

The Subject Property is generally flat but the surrounding area slopes towards the east with up-gradient properties to the west. Based on information obtained during a Limited Phase II Subsurface Investigation, performed by CNS Management Corp in April of 2005, groundwater

is approximately 5 feet beneath the cellar level. Based on the local topography, groundwater under the Subject Property is expected to flow east toward the Harlem River.

4.3 Historical Use Information

Langan reviewed available historic resources (including aerial photographs, Sanborn and topographic maps, and city directories) dated 1893 to 2013. Findings of the reviews are presented below.

4.3.1 Aerial Photographs

Langan reviewed aerial photographs of the Site and surrounding areas for the years 1924, 1954, 1966, 1975, 1984, 1994, 1995, 2006, 2009 and 2011. The photographs indicate that the Subject Property was improved with a building within a mostly developed urban area by 1924. By 1954 the site was improved with a multi-story building that spanned the entire site and surrounding properties were fully developed, except for a park on the west side of Broadway. The site and surrounding area have been largely unchanged since 1954. Langan's review of historical aerial photographs did not reveal evidence of RECs relative to the Subject Property. Copies of the aerial photographs are included in Appendix H.

4.3.2 Sanborn Fire Insurance Maps

A search for historical fire insurance maps for the Site and surrounding properties was conducted by EDR and reviewed by Langan. Sanborn Maps constitute a database of prior site uses of real property for many cities and towns in the United States. Copies of the maps are in Appendix I. The following table presents descriptions and interpretations from the historical fire insurance map review. Descriptions presented in bold font are discussed as possible RECs below.

Year	Comments
1893	Subject Property: The Subject Property appears to be unimproved. Surrounding Properties: The surrounding area is mostly vacant. There is a structure labeled "Gas Holder," approximately 100 feet north (cross-gradient) of the Subject Property. This gas holder location coincides with the Con Edison Broadway/Dykyman Station discussed above in on Section 4.1.1. This facility was investigated under NYSDEC oversight, significant impacts were not found, and a letter of No Further Action Was issued. Based on information contained in the regulatory listing and the regulatory status of this former gas holder facility, it is not a REC in relation to the Subject Property.
1900	Subject Property: The Subject Property still appears vacant; however, the map shows several lot sub-division lines.

Year	Comments
	<p>Surrounding Properties: Surrounding properties are primarily unchanged, except that lot lines are shown and there are isolated residential buildings a block south of the Subject Property.</p>
1913	<p>Subject Property: The Subject Property appears to be unimproved.</p> <p>Surrounding Properties: Surrounding properties are largely unchanged from the previous map, except that Arden Street (previously not shown), is now present to the east of the Subject Property.</p>
1935	<p>Subject Property: The Subject Property is improved with a two-story building of unspecified use.</p> <p>Surrounding Properties: Surrounding properties are primarily occupied by multi-story residential and commercial buildings, some with stores, a church, and park land. The following REC was identified:</p> <ul style="list-style-type: none"> • A gasoline filling station with four gasoline tanks and grease pits is located at 4706 Broadway, approximately 250 feet north (cross-gradient) of the site.
1950	<p>Subject Property: The Subject Property appears primarily unchanged from the 1935 Sanborn map, except a portion along Broadway is identified as a garage and service station. Use of the western part of the Subject Property as a service station is a REC.</p> <p>Surrounding Properties: Surrounding properties are primarily occupied by multi-story residential and commercial buildings, some with stores, churches, and park land.</p>
1968 and 1969	<p>Subject Property: The northern part of the building is occupied by offices of the City Dept. of Welfare Services and the southern part of the building is occupied by a garage.</p> <p>Surrounding Properties: Surrounding properties are primarily occupied by multi-story residential and commercial buildings, some with stores, churches, and park land.</p>
1977, 1979, 1980, 1981, 1983, 1985, 1986, 1988, 1989, 1991, 1992, 1994, 1995, 1996, 2001, 2002, 2003, 2004 and 2005	<p>Subject Property: The Subject Property appears primarily unchanged, except that two gasoline tanks are shown in the southern portion of the garage on most maps (intermittently) for these years. On-site gasoline tanks are a REC.</p> <p>Surrounding Properties: The area surrounding the Subject Property remains generally unchanged from the 1969 map.</p>

Based on the review of the Sanborn Maps, the Subject Property appears to have a history of commercial use, including government offices, a service station, and a garage with two

gasoline tanks. Surrounding properties have been occupied by mostly residential and commercial buildings, some with stores, churches, and park land.

The Sanborn review revealed the following on-site RECs:

- A service station was located in the western part of the property in 1950.
- A garage with two gasoline tanks was located in the southern part of the property between 1977 and 1994.

The above uses may have resulted in leaks or spills of petroleum products or solvents that may have adversely impacted soil, groundwater, and/or soil vapor at the Subject Property.

The below off-site REC was also identified.

- 4706 Broadway, approximately 250 feet north (cross-gradient) of the Subject Property, was occupied by a gasoline filling station with USTs in 1935. Leaks or spills of petroleum at this facility may have adversely impacted groundwater and/or soil vapor at the Subject Property.

4.3.3 Historical USGS Topographic Quadrangles

Langan reviewed historical USGS Topographic Quadrangles obtained from EDR for information regarding past uses of the Subject Property. Quadrangle maps were available for the years 1897, 1947, 1956, 1966, 1979, and 1995. The Subject Property and immediately surrounding land appear undeveloped in 1897, when a stream, which emptied into the Harlem River, was located to the south of the property. The Subject Property and surrounding area were fully developed within an urban street grid as early as 1947 with park land to the west of Broadway. The review of the historic topographic maps did not reveal evidence of RECs. Copies of the topographic maps are provided in Appendix J.

4.3.4 City Directories

The City Directory Abstract, obtained from EDR, is a review of available business directories, including city, cross-reference, and telephone directories, at approximately five-year intervals for the years spanning 1920 through 2013. The Subject Property was listed as various commercial entities and offices, including a service station, garage, and/or automotive-related businesses between 1934 and 1950. Use of the Subject Property for these automotive-related businesses is a REC, as leaks or spills of petroleum products or solvents associated with this use may have adversely impacted soil, groundwater, and or soil vapor at the property.

Surrounding properties were listed as residences and various commercial businesses. In 1927, the directory lists the Electro Multi Lay Mfg Co, and apparent manufacturing facility, at 1 Sherman Avenue. Leaks or spills of solvents or petroleum at this facility may have adversely impacted groundwater and/or soil vapor at the Subject Property. This is considered a REC. This property was also listed in the NY Spills and PBS databases.

A copy of the City Directory Abstract is provided in Appendix K.

4.3.5 Environmental Lien Search

Langan contracted EDR to conduct an Environmental Lien search for the Subject Property. The results of the search, which included a compilation of available data and verification of the findings with the appropriate regulatory authorities, revealed that there are no Environmental Liens or other Activity and Use Limitations (AUL) associated with the Subject Property. A copy of the Environmental Lien Search is provided in Appendix L.

5.0 SITE RECONNAISSANCE

5.1 Methodology and Limiting Conditions

The site reconnaissance was conducted in a systematic manner focusing on the spatial extent of the Subject Property and then progressing to the adjacent and surrounding properties.

The assessment of the adjacent and surrounding properties was limited to identifying, if possible, any indications of past or current use that may involve the use, storage, disposal, or generation of hazardous substances or petroleum products; noting the general type of current use; the general topography of the surrounding area; and providing a general description of adjoining or adjacent structures.

5.2 Date and Time of Inspections

The site reconnaissance was performed at 3:00 pm on April 1, 2014 by Mimi S. Raygorodetsky and J. Patrick Diggins, of Langan, in the company of Gary Spindler, an employee of Park It! Management, the current building tenant. The weather at the time of the inspection was sunny and approximately 60°F.

5.3 General Site Setting and Reconnaissance Observations

The Subject Property is occupied by a two-story concrete and CMU building with a full cellar that spans the entire property footprint. The entire cellar and approximately half of the first and second floors are used as a commercial parking garage. The remaining portions of the first and second floors are either vacant or used to store decommissioned car lifts and abandoned antique cars. Inactive ceiling mounted heating and air conditioning units were observed on the second floor. According to Park It! Employees, only the offices (along Sherman Avenue) are heated and cooled with electric units. Below is a description of notable findings in each building area.

The cellar contains exposed piping and floor drains. A boiler room, containing three out-of-service boilers was identified along the southern wall of the cellar. An employee stated that the boilers were not active. Two possible fill port structures were identified on the concrete floor near the boiler room. Standing water was observed on the cellar floors. A hydraulic elevator room was identified along the north wall; significant black staining was observed on the floor of the elevator room; however, no visible cracks were observed in the floor. Several areas of the floor showed evidence of excavation and backfilling as evidenced by patchwork. Most of the patched areas were approximately 3 feet by 2 feet. A larger patched area, approximately 20 feet long by 10 feet wide, was identified next to the boiler room. This area

corresponds to the portion of the building where four vent pipes were observed from the sidewalk. Two 55-gallon drums with unknown contents were found along the north cellar wall. Several electrical boxes were also observed in the cellar.

Two offices, occupied by *Park It!* and *U-Haul*, are located in the southern corner of the first floor and are constructed of wood with sheet rock wall partitions. Two-foot by 4-foot dropped ceiling tiles and 1-foot by 1-foot vinyl floor tiles were observed throughout the first floor office space.

There was automobile staining on the floors throughout the second story and standing water in several places.

The roof was not accessible for inspection during the site reconnaissance.

Pits, Ponds, Lagoons

Pits, ponds and lagoons were not observed at the Subject Property.

Pools of Liquid

Langan observed pools of standing water in the cellar and in the garage portion of the second floor.

Storm Drains, Wells, and Cisterns

Storm drains, wells, and/or cisterns were not observed on the Subject Property.

Polychlorinated Biphenyl (PCB) Transformers and Suspect Equipment

A transformer was observed on the Sherman Avenue sidewalk, immediately adjacent to the Subject Property. Fluorescent light ballasts and window caulking was observed in the building and may contain PCBs.

Storage Containers and Drums

Storage containers were not observed; however, two 55-gallon drums with unknown contents were found along the north cellar wall. The drums appeared to be in good condition and no staining was noted on the floors around the drums.

Air Emissions or Wastewater Discharges

Evidence of air or wastewater discharges was not observed at the Subject Property.

Floor Drains, Sumps, and Sewage Ejector Pit

Floor drains were observed throughout the building. Evidence of staining, corrosion, or other impacts was not observed within the vicinity of the floor drains.

USTs or ASTs

Two potential fill ports, indicative of USTs were observed adjacent to the boiler room. Three-foot by 2-foot patches and a 20-foot by 10-foot patch in the floor were also observed in this area, indicative of UST removal operations.

One vent pipe on the sidewalk and three vents on the roof, indicative of existing or former petroleum bulk storage tanks, were observed on the sidewalk at the Sherman Avenue entrance to the building.

Stained or Discolored Soil

Stained or discolored soil was not observed.

Leachate or Seeps

Leachate or seeps were not observed at the Subject Property.

Adjoining and Surrounding Property Uses

The Subject Property is adjoined by a five-story mixed-use commercial and residential building to the north; multi-story residential buildings to the east; Sherman Avenue, followed by multi-story residential and commercial buildings to the south; and Broadway, followed by Fort Tryon Park, to the west. Beyond adjoining properties, the area is primarily comprised of multi-story commercial and residential buildings, parking facilities, churches, and parks.

Site Reconnaissance Conclusions

Our conclusions based on the Site Reconnaissance are listed below:

- The observed fill ports, vent pipes, and patch work in the floor adjacent to the cellar boiler room are indicative of current and/or former petroleum bulk storage. As stated in Section 4.1.1 there is an open spill related to USTs at the Subject Property; therefore, on-site petroleum bulk storage (current or former) is considered a REC.

- Based on the age of the building, building materials may contain ACM, lead-based paint (LBP), and PCBs. Potential ACM, LBP, and PCBs is considered an additional (non-ASTM) environmental concern.
- Stored chemicals and black staining on the basement floor is a de minimis concern as the concrete floor in these areas appeared to be in good condition.

6.0 INTERVIEWS

6.1 Subject Property Owner

Tom Julius, of Acadia Sherman Avenue, LLC (the Owner), completed an owner questionnaire. Mr. Julius is not aware of any environmental cleanups, environmental assessments, environmental cleanup liens, land use limitations, associated with the Subject Property. The information provided in the Owner Questionnaire is described in Section 3.1 of this report and the completed questionnaire is included in Appendix B.

6.2 Subject Property Occupant

Gary Spindler, a representative of Park It! Management, a tenant of the Subject Property building, completed an operator questionnaire and provided answers to questions pertaining to the Subject Property during the site reconnaissance. The information provided in the Owner/Occupant Questionnaire is described in Section 3.1 of this report and the completed questionnaire is included in Appendix B.

6.3 Owners/Tenants of Adjacent Properties

During site reconnaissance, interview with an employee of a laundromat, at 22 Sherman Avenue, was conducted to determine whether dry cleaning occurred on-site; the employee indicated that it did not.

7.0 ADDITIONAL SERVICES

7.1 Radon

Radon is a colorless, odorless radioactive gas that results from the natural breakdown of uranium minerals in soil, rock, and water, which subsequently enters the atmosphere. It can concentrate in buildings, entering through cracks and other penetrations of a building

foundation. Some areas are more likely to have elevated concentrations of radon than others, reflecting subsurface lithologic conditions.

According to the USEPA Radon Zone Map, the Subject Property is located in Zone 3, which indicates a predicted average indoor radon screening level less than 2 pico Curies per Liter (pCi/L). NYSDOH maintains a database of radon test results on a local and county level. According to the NYSDOH, 114 radon tests have been conducted within residential basements in New York County, with results for 89% of residential basements below 4.0 pCi/L (the USEPA action level for radon); and 58 radon tests have been conducted within the first floor of residences in New York County, with results for 98% of the first floor of residences below 4.0 pCi/L. Based on the available information, it is unlikely that elevated levels of radon gas are present at the Subject Property.

8.0 DEVIATIONS AND DATA GAPS

8.1 Deviations

Langan has performed a Phase I ESA of the Subject Property utilizing a standard of good commercial and customary practice that is consistent with the ASTM E1527-13. Significant deviations were not made to the above referenced standards.

8.2 Data Gaps

In order to address data gaps, additional sources of information may be consulted. According to ASTM E 1527-13, Section 8.3.2.3, "historical research is complete when either: (1) the objectives in 8.3.1 through 8.3.2.2 are achieved; or (2) data failure is encountered. Data failure occurs when all standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met. If data failure is encountered, the report shall document the failure and, if any of the standard historical sources were excluded, give the reasons for the exclusion."

This Phase I ESA was completed without data gaps except for the following:

- Responses to all FOIA requests have not been received.
- The building roof of the Subject Property was not accessible for inspection.

The above listed data gaps are not expected to impact the overall conclusions of this Phase I ESA.

9.0 FINDINGS, CONCLUSIONS, AND OPINIONS

This Phase I ESA was conducted in accordance with the American Society for Testing Materials (ASTM) Practice E1527-13 (Standard Practice for ESA: Phase I ESA Process), which also satisfies the United States Environmental Protection Agency's (USEPA) All Appropriate Inquiry (AAI) Rule needed to qualify for the bona fide prospective purchaser liability protections available under the Comprehensive Environmental Response Compensation and Liability Act (CERCLA). The objective of this Phase I ESA was to identify the presence or likely presence, use, or release on the Subject Property of hazardous substances or petroleum products as defined in ASTM E1527-13 as a recognized environmental condition (REC). Releases of volatile organic compounds to the subsurface may result in vapor intrusion into existing or future buildings.

The Phase I ESA identified the following RECs and HRECs:

REC 1- Petroleum Bulk Storage, Historic Fueling and Service Station Use and Open Spill on the Subject Property

A New York State (NYS) Petroleum Bulk Storage (PBS) listing indicated a 2,500 gallon underground storage tank (UST) and a 5,000-gallon UST, each containing No. 2 fuel oil, were closed and removed from the Subject Property in 1998 and a 5,000-gallon No. 4 oil aboveground storage tank (AST) and three 550-gallon gasoline USTs were closed and removed from the Subject Property in 2009. The New York City Department of Buildings classified the Subject Property as G1-Garage/Gas Station and historical Sanborn maps indicated the property was used as a service station and garage. During the 2009 UST removals, petroleum impacts were observed in soil and groundwater, a spill was reported to the New York State Department of Environmental Conservation (NYSDEC), and spill number 0902240 was assigned.

A review of previous environmental reports revealed that remedial action was undertaken in 2009 to address the spill. After the USTs were decommissioned and removed, petroleum-impacted soil was removed and a RegenOx[®] (chemical oxidant) injection was performed to treat impacted groundwater. The remedial excavation and RegenOx[®] injections were focused in the former tank areas proximate to the basement boiler room. Groundwater was monitored for two years following the remedial action; analytical results did not show contaminant reductions that satisfied NYSDEC and the spill remains open.

REC 2 – Historical Use, Open Spill and Petroleum Bulk Storage on Adjoining and Surrounding Properties

Around 1935, a gasoline filling station was located at 4706 Broadway, approximately 250 feet north (cross-gradient with respect to anticipated groundwater flow direction) of the Subject Property. Around 1927, a manufacturing facility was located at 1 Sherman Avenue (also identified as 107-119 Ellwood Street), a southern adjoining property across Sherman Avenue.

NYSDEC Spill No. 0809967 is associated with 1 Sherman Avenue. The spill was closed on November 22, 2013; however, the database listing indicates that impacted soil is still present on the site; no information related to groundwater sampling was available for review. In addition, the property is listed on the PBS database (Facility ID 2-189472). There is one 4,500-gallon AST listed as “in service.”

Historic RECs and De Minimis Concerns

A closed spill (NYSDEC Spill No. 0604479), related to a tank overfill on the sidewalk at the Subject Property, is considered a Historic REC (HREC). The incident was contained, cleaned up, and closed by the NYSDEC within one day.

Automobile staining on the basement floor is a de minimis concern as the concrete floor in these areas appeared to be in good condition. There are floor drains throughout the building; however none had petroleum staining around them. Storage of 55-gallon drums in the basement is a de minimis concern as the drums do not appear to be leaking.

Additional information related to RECs, HRECs, and de minimis concerns can be found in the body of this report.

11.0 STATEMENT OF QUALIFICATIONS AND SIGNATURES

Langan declares that, to the best of its professional knowledge and belief, the personnel who performed this Phase I ESA meet the definition of Environmental Professional as defined in Subsection 312.10 of 40 CFR 312 and that they have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Subject Properties. They have developed and performed the Phase I ESA in conformance with the standards and practices set forth in ASTM Practice E1527-13, which also satisfies the USEPA AAI Rule. Resumes outlining the qualifications of the Environmental Professionals who performed this Phase I ESA are provided in Appendix M.

User/Owner Questionnaires

LANGAN

ASTM PRACTICE E 1527-13: USER/CLIENT QUESTIONNAIRE

Please complete the below form and return to
Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.

In order to qualify for one of the Landowner Liability Protections (LLPs) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"), the User must conduct the following inquiries required by 40 CFR 312.25, 312.26, 312.29, 312.30, and 312.31. The User is defined as the party seeking to use Practice E1527 to complete an environmental site assessment of the property. A User may include, without limitation, a potential purchaser of property, a potential tenant of property, an owner of property, a lender, or a property manager. These inquiries must also be conducted by the EPA Brownfield Assessment and Characterization grantees. The User should provide the following information to the environmental professional failure to conduct these inquiries could result in a determination that "all appropriate inquiries" is not complete.

General Information

User/Client Name (s): Acadia Realty Trust

Property Name: Sherman Plaza

Address: 4650 Broadway

New York, N.Y.

Property Type: Commercial

Type of Property Transaction:

- Purchase of property
- Financing of property
- Sale of property
- Ground lease
- Build to Suit Lease
- ✓ Other: Rezoning Application

Reason Why Phase I ESA is required: CEQR requirements

Site Contact (s): Tom Julius (914) 288-3307

Required Information

The citation at the end of each item (e.g. 40 CFR 312.30) is the section of EPA's November 1, 2005 AIA Final Rule which discusses that item.

LANGAN

<p>(1.) Environmental liens that are filed or recorded against the property (40 CFR 312.25). Did a search of recorded land title records (or judicial records, where appropriate, see Note 1 below) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?</p>	<p>Yes <input type="checkbox"/></p>	<p>No <input checked="" type="checkbox"/></p>
<p>Note 1 – In certain jurisdictions, federal, tribal, state or local statutes or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.</p>		
<p>(2.) Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(i)(v) and (vi)). Did a search of recorded land title records (or judicial records where appropriate, see Note 1 above) identify any AULs, such as engineering controls, and use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?</p>	<p>Yes <input type="checkbox"/></p>	<p>No <input checked="" type="checkbox"/></p>
<p>(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.26). Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?</p>	<p>Yes <input type="checkbox"/></p>	<p>No <input checked="" type="checkbox"/></p>
<p>(4.) Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29). (a.) Does the purchase price being paid for this property reasonably reflect the fair market value of the property? (If no, proceed to Part 5.) (b.) If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?</p>	<p>Yes <input checked="" type="checkbox"/></p> <p>No <input type="checkbox"/></p>	<p>No <input type="checkbox"/></p> <p>Yes <input checked="" type="checkbox"/></p>
<p>(5.) Commonly known or reasonably known or reasonably ascertainable information about the property (40 CFR 312.30). Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, see user: (a.) Do you know the past uses of the property? (b.) Do you know of specific chemicals that are present or once were present at the property? (c.) Do you know of spills or other chemical releases that have taken place at the property? (d.) Do you know of any environmental changes that have taken place at the property?</p>	<p>Yes <input type="checkbox"/></p> <p>No <input checked="" type="checkbox"/></p> <p>No <input type="checkbox"/></p> <p>No <input checked="" type="checkbox"/></p> <p>No <input type="checkbox"/></p> <p>No <input checked="" type="checkbox"/></p>	<p>No <input type="checkbox"/></p> <p>Yes <input type="checkbox"/></p> <p>No <input checked="" type="checkbox"/></p> <p>Yes <input checked="" type="checkbox"/></p> <p>No <input checked="" type="checkbox"/></p>
<p>(6.) The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31). Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?</p>	<p>Yes <input type="checkbox"/></p>	<p>No <input checked="" type="checkbox"/></p>

EXECUTIVE SUMMARY

The following is a summary of the findings obtained during the "Phase I" environmental site assessment conducted at the subject property located at 4650 Broadway and 2 Sherman Avenue, in the Borough of Manhattan, City and State of New York.

During the time of this assessment, the subject property consisted of a two-story commercial building (constructed in 1928) occupied by the New York City Human Resources Administration (NYCHRA) for office and public service purposes and a parking garage. The parking garage occupies the full basement and the southern portion of the first and second floors. The NYCHRA occupies the northern portion of the first and second floors. A boiler room is located at the southwestern portion of the basement.

Information obtained during the course of this assessment revealed that the NYC Department of Welfare and a garage occupied the site since the 1960s. The subject building was, reportedly, used for automobile sales and service purposes from the time of construction until at least the 1950s. Prior to construction of the existing building, the subject property, reportedly, consisted of undeveloped and/or vacant land.

A visual inspection of the boiler room revealed three (3) boiler units, numerous containers of waste oil, areas of oil-like staining, a 6,000-gallon fuel oil tank encased in concrete and situated within a concrete dike, an empty concrete containment dike (location of former fuel oil tanks), four (4) floor drains, and a sump pit and pump. One (1) floor drain located near the boiler units appeared to be subject to discharge of an oil-like substance.

A visual inspection of the parking garage facility revealed the following: numerous floor drains throughout the concrete floors, an access plate, three (3) inaccessible rooms (one reportedly an elevator motor room), and small areas of anti-freeze and oil stains within the basement; an office, restrooms, at least fourteen (14) floor drains, and a grease gun on the first floor; at least thirteen (13) floor drains and a storage room with automobile batteries on the second floor.

A visual inspection of the NYC Human Resources Administration office revealed the following: a "blower" room on the first floor with a concrete patch and two (2) compressed gas cylinders. This unit consisted primarily of open office space, public waiting rooms, private offices, and classrooms.

A visual inspection of the exterior portions of the subject property revealed a fill port and vent pipe associated with the 5,000-gallon fuel oil tank within the boiler room.

A review of surrounding property use revealed one (1) business, i.e., Henry's Cleaners, situated in close proximity to the subject property, which is known to us as being associated with the type of operation that historically represents a potential for adverse impact to the environment.

A review of Historical Sanborn maps revealed two (2) gasoline tanks depicted near the entrance of the garage in 1994, 1988, 1986, 1985, 1980, 1979, and 1977.

Documentation at the Borough of Manhattan Building Department revealed permits for two (2) gasoline tanks, one installed in 1934 and the other in 1941. Further, this agency documents that one (1) 5,000-gallon and one (1) 2,500-gallon fuel tanks were removed from the site (filed in 1999) and replaced with one (1) 5,000-gallon fuel oil tank.

Documentation obtained from Bermont Operating Corp. indicated that three (3) 550-gallon underground gasoline tanks were abandoned (filled with concrete) at the site in 1983.

Information obtained from the NYC Fire Marshal indicated that one (1) 5,000-gallon and one (1) 2,500-gallon fuel oil tanks were registered at the subject property.

A review of the NYSDEC Underground Storage Tank (UST) Database revealed that one (1) 5,000-gallon and one (1) 2,500-gallon vaulted underground fuel oil tanks were closed/removed from the subject property on 9/1/98.

A review of the NYSDEC Aboveground Storage Tank (AST) Database revealed that one (1) 5,000-gallon aboveground fuel oil tank was installed at the site on 10/1/98. The tank is situated within a concrete dike on saddles, stilts, rack, or cradle. The tank was certified on 9/28/01 which expires on 12/30/06.

A review of federal and state information (obtained from the USEPA and NYSDEC) indicated there were no reported incidents concerning hazardous materials or wastes, major spills, or existing landfills at the subject property. The subject property was not listed as a NYSDEC Inactive Hazardous Waste Disposal Site, NPL (Superfund), or CERCLIS Site. The subject property did not appear within the NYSDEC Spill Sites Database, the NYSDEC Leaking Storage Tank Database or as an RCRA Small or Large Quantity Generator (SQG) Site.

The subject building currently utilizes fuel oil as an energy source for its heating units. Electricity is supplied to the subject property by Consolidated Edison (ConEd). The subject property is supplied potable water by the New York City Water Authority. The subject building is, reportedly, connected to the New York City Municipal Sewer System for the disposal of on-site sanitary wastes.

Based on the information obtained during the scope of this assessment, specific recommendations are cited within Section 12.0 of this report.

1.0 PURPOSE

The principal objectives of this "Phase I" environmental site assessment were to identify and evaluate current site conditions, the visual presence or absence of contamination, possible sources of contamination, and potential environmental impairments at the subject property. The assessment was limited to historical research and site reconnaissance to evaluate the existence of any such conditions.

Consistent with generally accepted protocols, the "Phase I" environmental site assessment did not include sampling or analysis of suspect materials (with the exception of that related to asbestos containing materials) which may have been observed on the subject property. The format of this assessment was predicated upon general guideline requirements established by individual lending institutions, American Society for Testing and Materials Standards (ASTM) (E1527-00 & 1528-00), various professional organizations, and our professional judgment.

1.1 Introduction

Soil Mechanics Environmental Services was retained by Mr. Steven Hornstock of Murray Hill Properties to perform a "Phase I" environmental site assessment at the referenced property. Reconnaissance of all accessible portions of the subject property and of any improvements was performed by Soil Mechanics personnel on December 28, 2002.

1.2 Site Location

The subject property is located at 4650 Broadway and 2 Sherman Avenue, north of Sherman Avenue, south of Dongan Place, and east of Fort Tryon Park, in the Borough of Manhattan, City and State of New York (see Project Location Plan - Figure #1). The subject property is currently designated as Block: 2175 and Lot: 1 at the Borough of Manhattan Tax Assessor's Office.

1.3 Scope of Work

Various items were identified during the scope of this investigation which included:

1. A thorough visual inspection ("walk-through") of the subject property.
2. A survey of the adjacent properties for current land use.
3. Review of historical aerial photographs and/or Sanborn Maps in order to identify past and present land usage at the subject property.
4. Review of ownership history (title search) in an attempt to identify previous owners who may have impacted the environmental quality of the subject property.
5. Review latest information from federal, state, and local agencies, regarding environmental concerns at the subject property and any surrounding sites.
6. Evaluation of various factors obtained during the investigation.

2.0 SITE HISTORY

The subject property currently consists of a two-story commercial building (constructed in 1928) occupied by the New York City Human Resources Administration for office and public service purposes and a parking garage. The subject building was, reportedly, used for automobile sales and service purposes from the time of construction until at least the 1950s. The City of New York has used the northern portion of the subject building for office purposes since at least the 1960s. Subsequent to the building's use as an automobile sales and service facility, the southern portion of the building has been utilized as a parking garage. Prior to construction of the existing building, the subject property, reportedly, consisted of vacant and/or undeveloped land.

2.1 EDR Sanborn - City Directory Abstract

The EDR-City Directory Abstract (obtained from EDR, Inc., 3530 Post Road, Southport, CT) is a historical search wherein business directories, including city, cross reference and telephone directories, are viewed, if available, at approximate five year intervals for the years spanning 1920 through 2000 (these years are not necessarily inclusive). Review of this information revealed that Packard Motor Car Company of NY occupied the subject property in 1934 (please refer to EDR-City Directory Abstract within Appendix).

2.2 Review of Historical Sanborn Maps

A review of historical Sanborn Maps (obtained from EDR Sanborn Inc., Southport, CT) dated 1893, 1900, 1913, 1935, 1950, 1968, 1969, 1977, 1979, 1980, 1981, 1983, 1985, 1986, 1988, 1989, 1991, 1992, 1994, and 1996, was conducted to identify past land usage at the subject property and surrounding area. A review of these Sanborn maps revealed the following (see attached select copies within Appendix):

1996 Sanborn Map

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1904 Sanborn Map

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. Two (2) gasoline tanks are depicted near the entrance to the garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1992, 1991, and 1989 Sanborn Maps

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1988, 1986, and 1985 Sanborn Maps

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. Two (2) gasoline tanks are depicted near the entrance to the garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1983 and 1981 Sanborn Maps

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1980, 1979, and 1977 Sanborn Maps

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. Two (2) gasoline tanks are depicted near the entrance to the garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1968 and 1968 Sanborn Maps

The subject property consisted of the existing two-story commercial building (constructed in 1928) occupied by the City of New York Department of Welfare Office and a garage. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1950 Sanborn Map

The subject property consisted of the existing two-story commercial building occupied by a garage and service facility. The surrounding land use consisted of multi-story apartment buildings to the north and east. Please note that property use to the south and west was not provided.

1935 Sanborn Map

The area of the subject property is illegible on this map, therefore, property use is unknown. The surrounding land use consisted of multi-story apartment buildings and a used car lot to the north and multi-story apartment buildings to the east. Please note that property use to the south and west was not provided.

1913 Sanborn Map

The subject property consisted of vacant and/or undeveloped land. The surrounding land use consisted of vacant and/or undeveloped land, a dwelling, and Consolidated Gas Company with a gas holder to the north and vacant and/or undeveloped land and Consolidated Gas Company store house to the east. Please note that property use to the south and west was not provided.

1890 Sanborn Map

The subject property consisted of vacant and/or undeveloped land. The surrounding land use consisted of vacant and/or undeveloped land, a dwelling, and Consolidated Gas Company with a gas holder to the north and vacant and/or undeveloped land to the east. Please note that property use to the south and west was not provided.

1893 Sanborn Map

The subject property consisted of vacant and/or undeveloped land. The surrounding land use consisted of vacant and/or undeveloped land to the north, south, and east and two small unidentified structures to the west.

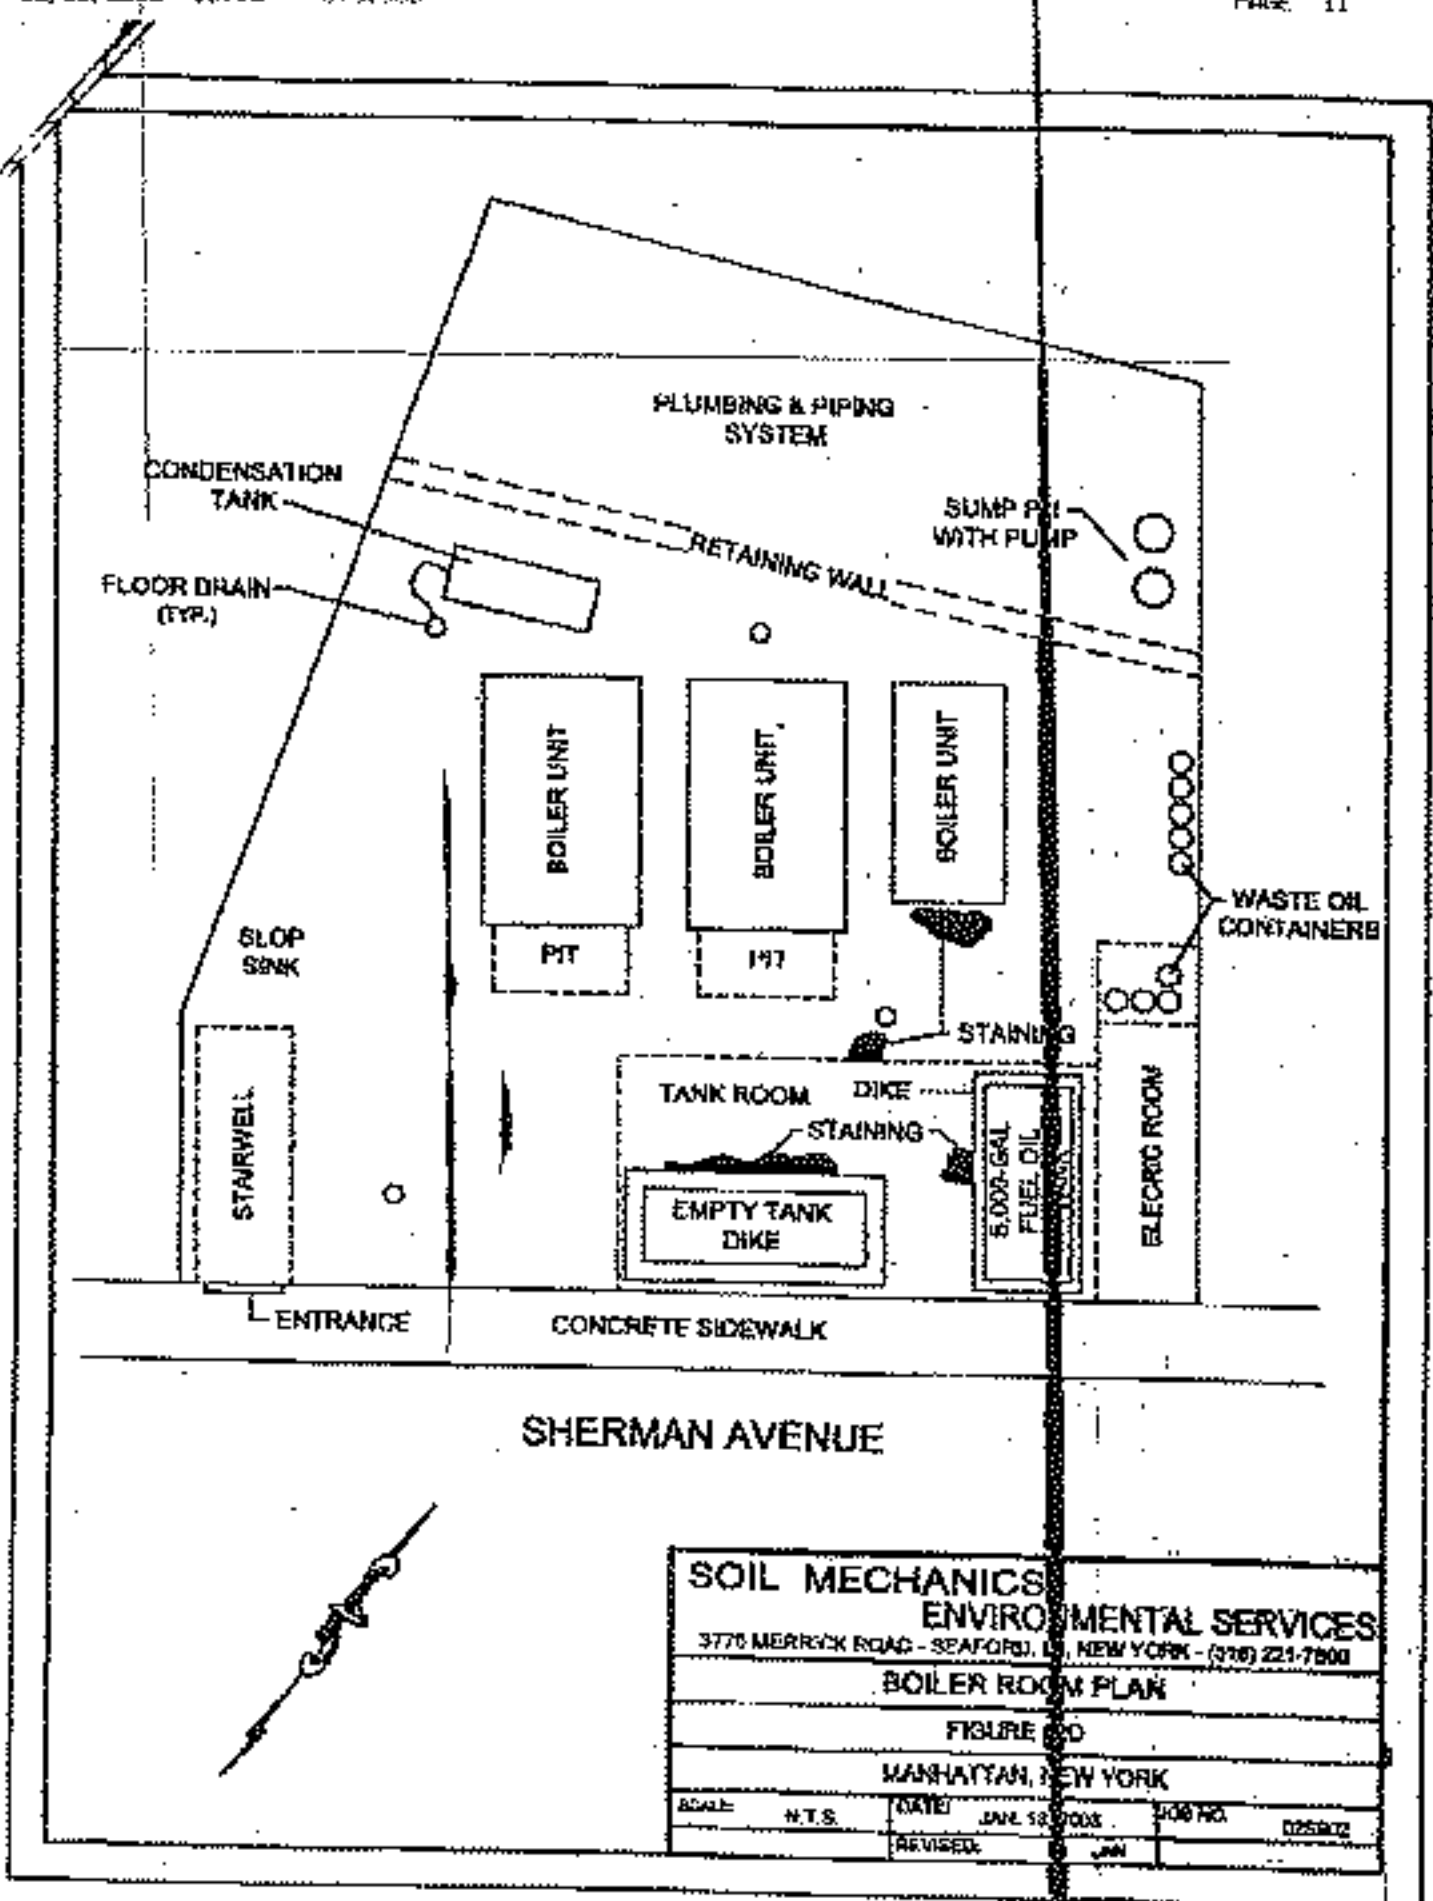

2.3 History of Ownership

A review of ownership records (title search) maintained at the Borough of Manhattan Tax Assessor's Office was conducted for the subject property in order to identify any former ownership that may have impacted the environmental quality of the subject property. Several of the names on record, i.e., automotive repair companies, are known to us as being associated with the types of operations that could have generated, manufactured, sold, or distributed hazardous materials or hazardous waste.

3.0 SITE DESCRIPTION

3.1 Facility Overview

During the time of this assessment, the subject property (approximately 40,000 square feet) consisted of a two-story commercial building with a full basement, currently occupied by the New York City Human Resources Administration (4650 Broadway) for office and public service purposes and a parking garage (26 Sherman Avenue). The subject building occupies virtually the entire area of the site, which is surrounded by a concrete sidewalk and adjacent apartment buildings (see Site Plan - Figure #2A-2D)(see attached photo-log within Appendix).

3.2 Visual Inspection (Interior)

A visual inspection of the interior portions of the subject building revealed it to be divided into two (2) commercial units: New York City Human Resources Administration (NYCHRA) and a parking garage. The NYCHRA occupies the first and second floors of the northern portion of the subject building. The parking garage occupies the full basement and the first and second floors of the southern portion of the subject building. The boiler room is also located in the basement, however, is only accessible from a first floor entrance door located along Sherman Avenue. The following specific items were identified:

New York City Human Resources Administration (6650 Broadway)

- The first and second floors of this unit consisted primarily of open office space, public waiting rooms, private offices, and classrooms. Several restroom facilities and storage rooms are located on the first and second floors. One of these storage rooms was observed to house a sump sink and cleaning materials for custodial services. No staining was visually identified on or around this sink. Further, a "blower" room was also located on the first floor. This room contained hot air blowers and ventilation systems, automatic sprinkler pipes, two (2) compressed gas cylinders, and a small circular concrete patch. This unit is serviced by an elevator located at the northwestern portion of the building.

Parking Garage (2 Sherman Avenue)

- The parking garage occupies the full basement (minus the boiler room) and the first and second floors of the southern portion of the subject building.

- The basement level consisted primarily of open parking space. Exit stairs are situated at the eastern and western sides of the garage. An inaccessible access plate was visually identified near the western exit stair. Numerous floor drains were observed throughout the concrete floor area. Also, three (3) inaccessible rooms were observed: one beneath the ramp to the first floor, one at the northwest corner and one at the northeast corner. Information obtained during this assessment indicates that

the room at the northwest corner of the basement is the elevator motor room. The contents of the remaining two rooms are unknown. Several small areas of oil and anti-freeze staining and pooling were observed at various locations. This condition is likely the result of incidental leakage and spillage from parked automobiles.

- The first floor of the parking garage consisted of a small office, restrooms, and an open parking area. At least fourteen (14) floor drains were observed in the concrete floor area. A grease gun was also observed attached to the ceiling within what appears to be a former service stall.

- The second floor of the parking garage consisted primarily of an open parking area. At least thirteen (13) floor drains were observed within the concrete floor area. A small room at the southeast corner was used for miscellaneous storage. Several automobile batteries were visually identified in this room.

Boiler Room

- The boiler room is located within an enclosed room in the basement accessible from a door along Sherman Avenue. Three (3) boiler units, a condensation tank, a slop sink, and four (4) floor drains were observed in the main boiler room. Oil-like staining was observed near a floor drain located in front of the boiler units. An absorbent material (i.e., Speedi-dry) had been applied to the stained area. Pits in front of two (2) of the boiler units were filled with sediment. As such, the presence of additional floor drains in these areas can not be discounted.

- A tank room with two (2) concrete containment dikes was located at the southern portion of the boiler room. One of these dikes was empty, however, evidence (i.e., concrete rubble, piping, oil-like staining) of a former heating oil tank was observed. A 5,000-gallon #4 fuel oil tank was located within the second containment dike. This tank was encased within a concrete vault. Oil-like staining was visually identified on the concrete vault and floor within this room.

- An electric room was located at the southeast corner of the boiler room. This room contained electric fuse boxes and switch boards.

- A small room, located next to the electrical room, was observed to contain four (4) small containers of waste oil. Several additional waste oil containers were located along the eastern wall of the boiler room.

A concrete retaining wall separated the northern and southern sections of the boiler room. Plumbing and piping systems and a sump pit with associated pump were observed on the northern side of this wall. The sump pit was partially filled with water at the time of our inspection.

3.3 Visual Inspection (Exterior)

A visual inspection of exterior portions of the subject property revealed the following specific items:

- The north and eastern borders of the subject property abut adjacent multi-story apartment buildings.

- The western and southern portions of the subject building border a concrete sidewalk. A sub-grade electrical transformer vault and a fill port and vent pipe were visually identified within the concrete sidewalk outside the southern portion of the subject building. The fill port and vent pipe are likely associated with the 5,000-gallon #4 fuel oil tank within the boiler room.

4.0 VISUAL DISTURBANCES

During this inspection, the subject property revealed no visible evidence that could be attributed to major spills or discharges of hazardous materials or hazardous wastes.

All existing vegetation, on or about the subject property, appeared in good condition and showed no signs of unusual stress being placed upon it relative to the environmental conditions at the subject property.

5.0 SITE OPERATIONS AND UTILITIES

5.1 Electrical Transformer(s)

There were no pole and/or pad-mounted electrical transformers visually identified on or contiguous to the subject property. A sub-grade transformer vault was, however, visually identified within the concrete sidewalk outside the southern portion of the subject building.

5.2 Aboveground Storage Tank(s)

One (1) 5,000-gallon aboveground #4 fuel oil tank was visually identified within the boiler room. This tank was situated within a concrete containment dike and was encased in concrete. According to the NYSDEC Petroleum Bulk Storage (PBS) Database, this tank was installed at the site on 10/1/98. The tank is situated within a concrete dike on saddles, stilts, rack, or cradle. The tank was certified on 9/25/01 which expires on 12/30/08.

5.3 Underground Storage Tank(s)

During the time of our inspection, no evidence (i.e., fill ports, vent pipes) of any underground storage tanks (USTs) was visually identified at the subject property. Further, a response to our Record Search Request submitted to the NYS Fire Marshal indicated that there is no record of underground storage (gasoline) tanks at the subject property (4660 Broadway and 2 Sherman Avenue, Manhattan, NY).

5.4 Suspect/Former/Removed Underground Storage Tank(s)

A review of historical Sanborn maps revealed that two (2) gasoline tanks were located near the entrance to the garage in 1904, 1988, 1986, 1985, 1980, 1979, and 1977. Information obtained from the Borough of Manhattan Building Department indicated that two (2) gasoline tanks were installed at the subject property: one in 1934 and one in 1941. No information was obtained documenting the removal of any gasoline tanks. Documentation obtained from Belmont Operating Corp., however,

revealed that three (3) 550-gallon underground gasoline tanks were decommissioned by Gaservice Maintenance Corp. in January of 1988. According to the affidavit, all gasoline was removed and the tank filled with concrete along with all lines except vents. This affidavit and accompanying correspondence were submitted to the NYC Fire Marshal, however, no response documentation was available (see copies within Appendix).

Documentation obtained from the NYSDEC Petroleum Bulk Storage (PBS) Database, the New York City Fire marshal and the Manhattan Building Department revealed that one (1) 5,000-gallon and one (1) 2,500-gallon vaulted underground fuel oil tanks were closed/removed on 9/1/88. No other information was available. A visual inspection of the boiler room revealed evidence of former heating oil tank(s). The presence of an empty concrete dike, concrete rubble, piping systems, and oil-like staining all indicate that fuel oil tank(s) were formerly located in this area.

6.5 Utilities

The subject building currently utilizes fuel oil as an energy source for its heating units. Electricity is supplied to the subject property by Consolidated Edison (ConEd). The subject property is supplied potable water by the New York City Water Authority. The subject building is, reportedly, connected to the New York City Municipal Sewer System for the disposal of on-site sanitary wastes.

6.6 Hazardous Materials/Wastes Storage and Disposal

There are no current operations at the subject property involving the use and/or disposal of hazardous chemicals or hazardous waste. Various petroleum products were, however, stored within the subject building. These items included numerous small containers of waste oil identified within the boiler room.

6.7 Water Supply/Monitoring Well(s)

There was no visible evidence to indicate the presence of any groundwater monitoring and/or water supply wells throughout the subject property.

6.8 Interior Drainage Structure(s)

Numerous floor drains were visually identified at interior portions of the subject building. Four (4) were visually identified within the boiler room, at least thirteen within the second floor of the parking garage, at least fourteen (14) within the first floor of the parking garage, and numerous floor drains within the parking garage basement. No staining was observed in the vicinity of the floor drains within the parking garage. Oil-like staining was, however, observed near a floor drain located in front of the boiler units. The discharge point(s) of these drains is unknown. Please be advised that, due to numerous parked cars in the parking garage and sediments observed within pits in front of two (2) boiler units, these areas were not accessible for visual inspection. As such, additional floor drains may exist.

6.9 Exterior Drainage Structure(s)

There were no subsurface drainage structures (drywells, floor drains, trench drains, etc.) visually identified at exterior portions of the subject property.

6.10 SURROUNDING PROPERTY USE

Adjacent land use surrounding the subject property consisted of the following (see Figure #B - Surrounding Land Use Map):

North of the site: Multi-story apartment buildings and Dongan Place.

South of the site: Fort Tryon Park, Broadway, and retail, commercial, and residential properties.

East of the site: Multi-story apartment buildings with retail on the first floor and Henry's Cleaners.

West of the site: Fort Tryon Park.

A review of surrounding property uses revealed one (1) business, i.e., Henry's Cleaners, situated in close proximity to the subject property, which is known to us as being associated with the type of operation that historically represents a potential for adverse impact to the environment.

7.0 AGENCY CONTACT

A review of various documentation, from appropriate federal, state and local agencies, was conducted for the purpose of identifying any history of hazardous waste activity known to have occurred at the subject property or within a one mile radius. The standard environmental sources reviewed and approximate minimum search distances are pursuant to ASTM standards.

7.1 Federal Agencies

The National Priority List (NPL) is a list of properties with the highest priority for cleanup pursuant to the USEPA's Hazard Ranking System. The subject property was not listed as an NPL Site. There were no NPL Sites listed within a one mile radius of the subject property.

The Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) is a list of sites compiled by the USEPA that they have investigated or are currently investigating for potential hazardous substance contamination and possible inclusion on the NPL. The subject property did not appear on the CERCLIS listing report. There were no CERCLIS Sites identified within a one-half mile radius of the subject property.

CERCLIS-NFRAP Sites are CERCLIS Sites designated "No Further Remedial Action Planned" (NFRAP) and have been removed from CERCLIS. NFRAP Sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. The subject property was not listed as a CERCLIS-NFRAP Site.

The USEPA Emergency Response Notification System (ERNS) is a computer database containing information on release notifications of oil and hazardous substances that have occurred throughout the United States and have been reported to the National Response Center (NRC) and/or one of the 10 EPA Regions. The subject property did not appear within the ERNS database.

The USEPA Resource Conservation and Recovery Information System (RCRIS) includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). The subject property was not listed as a RCRA-Treatment, Storage, and/or Disposal (RCRA-TSD) Site. There were no RCRA-TSD Sites identified within a one mile radius.

A review of the Resource Conservation and Recovery Act (RCRA) Database did not reveal any Large and/or Small Quantity Generator Sites adjacent to the subject property. The subject property was not identified as a RCRA Large and/or Small Quantity Generator Site.

The Corrective Action Report (CORRACTS) is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally defined corrective action core events have occurred for every handler that has had corrective action activity. The subject property did not appear as a CORRACTS Site. There were no CORRACTS Sites identified within a one mile radius of the subject property.

7.2: State Agencies

The State Hazardous Waste Sites (SHWS) records are the States' equivalent to CERCLIS. These sites may or may not already be listed on the Federal CERCLIS list. Priority sites planned for cleanup using State funds (State equivalent of Superfund) are identified along with sites where cleanup will be paid for by potential responsible parties. The data comes from the Department of Environmental Conservation's Inactive Hazardous Waste Disposal Sites in New York State. There were no NYSDEC Inactive Hazardous Waste Disposal Sites listed at the subject property. There were no NYSDEC Inactive Hazardous Waste Disposal Site identified within a one mile radius of the subject property.

Solid Waste Facility/Landfill Site type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the State, these may be active or inactive facilities or open dumps that fail to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites. The subject property was not listed as a NYSDEC Solid Waste Facility/Landfill Site. There were no BWF/LF Sites identified within a one-half mile radius of the subject property.

The Leaking Storage Tank (LTANK) Incident Report records contain an inventory of reported leaking storage tank incidents reported from April 1, 1985 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills. The subject property was not listed within the NYSDEC LTANK Database. A total of forty-one (41) LTANK Sites, however, have been identified within a one-half mile radius of the subject property, twenty-seven (27) of which have been documented as "closed" or "inactive" meaning that the spill has been cleaned up, all paper work completed and no further action is required by the NYSDEC. The remaining fourteen (14) sites, however, have been documented as

"active" meaning the spill investigations are ongoing. Please refer to Appendix for complete listing of NYSDEC LTANK Sites.

--- The Spills (SPILLS) Information Database includes spills active as of April 1, 1986, as well as spills occurring since that date. There were no NYSDEC Spill Sites identified at the subject property. A total of ninety-five (95) SPILL Sites were, however, identified within a one-half mile radius of the subject property. Fifty-five (55) of these Spill Sites have been documented as "closed" or "inactive" meaning that the spill has been cleaned up, all paper work completed and no further action is required by the NYSDEC. The remaining forty (40) sites, however, have been documented as "open" or "active" meaning the spill investigations are ongoing. Please refer to Appendix for complete listing of NYSDEC SPILL Sites.

The Underground Storage Tank (UST) Database contains registered UST's. UST's are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Conservation's Petroleum Bulk Storage (PBS) Database. The PBS Database lists facilities that have petroleum storage capacities in excess of 1,100 gallons and less than 400,000 gallons. The following PBS listing was identified at the subject property:

1) **Bermont Operating Corp.** -- located at 2 Sherman Avenue (PBS # 2-077666). According to the PBS report, one (1) 5,000-gallon and one (1) 2,500-gallon vaulted underground fuel oil tanks were closed/removed on 5/1/88. Notably, no NYSDEC LTANK and/or Spill Sites were documented at the subject property.

The following Underground Storage Tank (UST) Sites were identified adjacent to the subject property:

1) **12 Dongan Place** -- located just to the north of the subject property. According to the PBS report, one (1) 3,500-gallon underground fuel oil tank is located at this facility. This site was not listed as a NYSDEC LTANK and/or Spill Site.

02/17/2003 10:40

2) 19 Dongan Place – located just to the northeast of the subject property. According to the PBS report, one (1) 5,000-gallon vaulted underground fuel oil tank is located at this facility. No NYSDEC LTANK and/or Spill Sites were identified at this site.

NYSDEC AST List - Registered Aboveground Storage Tank (AST) List – this database contains listings of registered AST's. The data is provided by the NYSDEC Petroleum Bulk Storage (PBS) Database. The following NYSDEC Registered Aboveground Storage Tank (AST) was identified at the subject property:

1) **Bermann Operating Corp.** – located at 2 Sherman Avenue. According to the PBS report, one (1) 5,000-gallon aboveground fuel oil tank was installed at the site on 10/1/98. The tank is situated within a concrete dike on saddles, stilts, rack, or cradle. The tank was certified on 9/28/01 which expires on 12/30/06. Notably, no NYSDEC LTANK and/or Spill Sites were documented at the subject property.

The following NYSDEC Registered AST Sites were identified as adjoining the subject property:

1) **9-21 Sherman Avenue** – located just to the east-southeast of the subject property. According to the PBS report, one (1) 5,000-gallon fuel oil tank with asphalt coating is located at this facility. No NYSDEC LTANK and/or Spill Sites are documented at this site.

2) **Broadway & Ellwood Realty LLC** – located just to the south-southwest of the subject property at 646-48 Broadway. According to the PBS report, one (1) 5,000-gallon fuel oil tank with an epoxy liner and jacket is located at this facility. No NYSDEC LTANK and/or Spill Sites are documented at this site.

3) **29 Sherman Avenue** – located just to the east of the subject property. According to the PBS report, one (1) 5,000-gallon fuel oil tank with asphalt coating and situated within a concrete dike is located at this facility. No NYSDEC LTANK and/or Spill Sites are documented at this site.

4) 4672 Broadway - located just to the north-northwest of the subject property. According to the PBS report, one (1) 5,000-gallon fuel oil tank is located at this facility. No NYSEDEC TANK and/or Spill Sites are documented at this site.

7.8 Local Agencies

Record search request forms were submitted to the New York City Fire Department, Bureau of Fire Prevention in order to review any information they may have with respect to heating tanks and/or underground storage (gasoline) tanks at the subject property. A response from the NYC Fire Marshal indicated that they have no records of underground storage (gasoline) tanks at the subject property (4650 Broadway and 2 Sherman Avenue, Manhattan, NY).

Information pertaining to heating oil tanks revealed that one (1) 5,000-gallon and one (1) 2,500-gallon #4 fuel oil tanks are registered at 4650 Broadway. The permit, however, expired on 5/31/02 (see responses within Appendix).

Documentation from the Borough of Manhattan Building Department was obtained from the New York City web site (www.nyc.gov) in order to identify violations and/or information of environmental concern. Several building violations were listed, however, are related to structural issues, therefore, they are not included in this assessment. The following environmentally pertinent information was available (see copies within Appendix):

- A building permit (NB 149-26) was issued for the subject property on 7/5/26.
- A plumbing permit (P 1061-26) was also issued in 1926.
- An oil burner application (FO 960-87) was filed on 9/31/87.
- Two (2) gas tank permits (GT 126-84 & GT 283-41) were issued, one in 1934 and one in 1941.
- A violation filed on 8/11/94, indicating that a mercury gas test was performed on existing gas distribution piping system to obtain Cond turn on for existing boiler pilot. An inspection was conducted and no further action was required.

- An alteration, filed on 4/27/99, to replace one (1) new 5,000-gallon fuel oil tank wrapped in 4' concrete block and remove existing 5,000-gallon and 2,500-gallon fuel oil tanks.

8.0 HYDROGEOLOGIC INFORMATION

Information obtained from the 7.5 minute series, Central Park, NY Quadrangle, published by the US Department of the Interior, Geological Survey topographic map revealed the subject property is located approximately forty to fifty (40-50) feet above sea level (see Topographic Map - Figure #4).

Information concerning depth to ground water and detailed local groundwater flow direction is not readily available. However, based upon local topography and the property's proximity to the Harlem River, it is our opinion that the local ground water flow component in this area is trending to the east-northeast.

9.0 RADON POTENTIAL

According to the State of New York Department of Health's publication, Indoor Radon In New York State: Distribution, Sources, and Controls,

"Westchester County south of the Hudson Highlands, and Manhattan and Staten Islands are part of the southernmost extension of the New England Upland called the Manhattan Prong. Igneous and metamorphosed sedimentary rocks dominate the region. On Staten Island and in the Triassic Lowland Province in Rockland County is a prominent igneous intrusive rock, the Palisades diabase. The remainder of the Triassic Lowland is underlain by red sedimentary rocks of shale, sandstone, and conglomerate derived from the bordering highlands and deposited by fast moving streams. On the basis solely of existing indoor radon screening results, we surmise that the area southeast of the Hudson Highlands possesses little indoor radon potential."

10.0 ASBESTOS INSPECTION

An inspection of the subject facility was conducted by Testing Mechanics Corp. for the presence of friable asbestos-containing materials (ACM). The results of this investigation revealed the presence of friable ACM at various locations within the subject building. Please refer to Report of Phase I Asbestos Inspection within the Appendix for a full description of type and locations of friable ACM.

11.0 SUMMARY OF FINDINGS

- During the time of this assessment, the subject property consisted of a two-story commercial building (constructed in 1928) occupied by the New York City Human Resources Administration (NYCHRA) for office, public service, and parking. Information obtained during this assessment revealed that the NYC Department of Welfare and a garage occupied the site since the 1980s. The subject building was, reportedly, used for automobile sales and service purposes from the time of construction until at least the 1950s. Prior to construction of the existing building, the subject property, reportedly, consisted of undeveloped and/or vacant land.

- A visual inspection of the boiler room revealed three (3) boiler units, numerous containers of waste oil, areas of oil-like staining on the concrete floor, a 5,000-gallon fuel oil tank encased in concrete and situated within a concrete dike, an empty concrete containment dike (location of former fuel oil tanks), four (4) floor drains, and a sump pit and pump. One (1) floor drain located near the boiler units appeared to be subject to discharge of an oil-like substance.

- A visual inspection of the parking garage facility revealed the following: numerous floor drains throughout the concrete floors; an access plate, three (3) inaccessible rooms (one reportedly an elevator motor room), and small areas of anti-freeze and oil stains on the concrete floors within the basement; an office, restrooms, at least fourteen (14) floor drains, and a grease gun on the first floor; and at least thirteen (13) floor drains and a storage room with automobile batteries on the second floor.

- A visual inspection of the NYC Human Resources Administration office revealed the following: a "blower" room on the first floor with a concrete patch and two (2) compressed gas cylinders. This unit consisted primarily of open office space, public waiting rooms, private offices, and classrooms.

- A visual inspection of the exterior portions of the subject property revealed a fill port and vent pipe associated with the 5,000-gallon fuel oil tank located within the boiler room.

- A review of surrounding property use revealed one (1) business, i.e., Henry's Cleaners, situated in close proximity to the subject property, which is known to us as being associated with the type of operation that historically represents a potential for adverse impact to the environment.

- A review of historical Sanborn maps revealed two (2) gasoline tanks depicted near the entrance of the garage in 1904, 1988, 1986, 1985, 1990, 1979, and 1977.

- Documentation obtained at the Borough of Manhattan Building Department revealed permits for two (2) gasoline tanks, one installed in 1934 and the other in 1941. Further, this agency documents that one (1) 5,000-gallon and one (1) 2,500-gallon fuel tanks were removed from the site (filed in 1939) and replaced with one (1) 5,000-gallon fuel oil tank.

- Information obtained from Bermont Operating Corp. indicated that three (3) 550-gallon underground gasoline tanks were abandoned (filled with concrete) at the site in 1989. There was no regulatory documentation, however, to indicate this.

- Information obtained from the NYC Fire Marshal indicated that one (1) 5,000-gallon and one (1) 2,500-gallon fuel oil tanks were registered at the subject property.

- A review of the NYSDEC Underground Storage Tank (UST) Database revealed that one (1) 5,000-gallon and one (1) 2,500-gallon vaulted underground fuel oil tanks were closed/removed from the subject property on 9/1/98.

- A review of the NYSDEC Aboveground Storage Tank (AST) Database revealed that one (1) 5,000-gallon aboveground fuel oil tank was installed at the site on 10/1/98. The tank is situated within a concrete dike on saddles, stilts, rack, or cradle. The tank was certified on 0/28/01 which expires on 12/30/06.

- A review of the NYSDEC LTANK and Spill Sites Databases revealed fifty-four (54) "active" status spills within a one-half mile radius of the subject property.

- A review of the NYSDEC Petroleum Bulk Storage (PBS) Registration Database revealed two (2) UST Sites (12 & 19 Dongan Place) and three (3) AST Sites (9-21 Sherman Avenue, Broadway & Ellwood Realty LLC, 20 Sherman Avenue, and 4672 Broadway) listed as adjacent to the subject property. No NYSDEC LTANK and/or Spill Sites were listed at any of these facilities.

12.0 DISCUSSIONS, CONCLUSIONS AND RECOMMENDATIONS

In our opinion, based upon the scope of this investigation conducted at the site, which included a thorough visual investigation of the subject property, a survey of adjacent land use, examination of publicly available records, review of historical Sanborn maps, title search records and an evaluation of these factors, the following specific items are cited:

1) With respect to historical uses of the subject property (i.e., automobile sales and service/garage) and suspect/former underground storage tanks, it is our opinion that an appropriate Phase II investigation is warranted. This investigation should include, at a minimum, a geophysical survey to investigate the presence/absence of underground storage tanks depicted in historical Sanborn maps, an assessment of on-site soil quality in the vicinity of the abandoned 550-gallon underground gasoline tanks, and a tracer dye analysis of interior floor drains to confirm their final discharge point(s). Pending completion of this assessment, additional investigations and/or remediation may be warranted. We further recommend all on-site underground storage tanks be properly registered and decommissioned as per § NYCRR Parts 612-614 and 40 CFR Part 280, if necessary.

3) Storage of small containers of waste oil was observed within the boiler room and automobile batteries were stored within a second story room in the parking garage. We recommend that these items be stored in an appropriate manner with secondary containment capabilities in compliance with the appropriate regulatory guidelines. Further, oil-like and anti-freeze-like staining were observed at various locations in the boiler room and parking garage. This appears to be a result of "sloppy housekeeping" procedures and/or incidental discharges from parked automobiles. We recommend that these areas be cleaned and the generated waste properly disposed of. We further recommend increased diligence in housekeeping procedures with respect to incidental spill prevention and clean up.

3) We recommend that the compressed gas cylinders, identified in a "blower" room in the NYCHRA offices, be stored in a designated secure location in accordance with appropriate regulatory guidelines.

4) With respect to surrounding land use of potential environmental concern, i.e., Henry's Cleaners, this site appears to be positioned at a hydrodynamically down gradient position in relation to the subject property. Further, no NYSDEC LTANK and/or Spill Sites have been documented at this facility. Based on this information, it is our opinion that this site does not represent a significant threat to the groundwater quality beneath the project site.

5) A total of fifty-four (54) "active" status NYSDEC LTANK and Spill Sites have been identified within a one-half mile radius of the subject property. Of these, fifty-three (53) appear to be situated hydrodynamically down and/or cross gradient from the subject property. Therefore, based on this information and their relative distances from the subject property, it is our opinion that these sites do not pose a significant threat to the environmental quality at the subject property.

The remaining "active" status spill appears to be situated hydrodynamically up gradient from the subject property. According to the spill report, however, the groundwater was not affected. Further, this spill is under the jurisdiction of the NYSDEC. Based on this information and on its relative distance from the subject property, it is our opinion that no action is warranted at the present time.

6) With respect to the five (5) NYSDEC Petroleum Bulk Storage (PBS) sites identified adjacent to the subject property, no NYSDEC L/TANK and/or Spill Sites have been documented at these facilities. Based on this information, it is our opinion that no action is required regarding this matter at the present time.

I. Introduction

At the Request of Acadia Realty Trust, CNS Management, Inc. ("CNS") conducted an asbestos survey at 4650 Broadway in New York City, New York. The purpose of the survey was to identify asbestos-containing materials ("ACM") throughout the building that might be impacted in future renovation work. The work was conducted in accordance with New York City Department of Environmental Protection regulations and the United States Environmental Protection Agency guidelines.

Tenants within the building consist of Ideal Parking Corp. (107,315 square feet) and the New York City Department of Human Resources Administration "Dyckman Job Center" (88,252 square feet). Common building materials were identified within the built out spaces consisting of cove base molding, wall board partitions and acoustical ceiling tile systems. At the time of the survey a copy of analytical results from a survey completed by Anthony Gennaro, PE on February 19, 2004 was given to CNS, therefore the materials identified within the table was not sampled by CNS.

The building was constructed in 1928, which indicates that ACM may be present. The United States Environmental Protection Agency (EPA) started to impose bans on asbestos products from 1973 to 1978. The first ban of asbestos was in 1973 for the use of asbestos in spray-on fire proofing and thermal insulations. In 1979 the EPA announced its intention to issue a rule that bans all uses of asbestos. In 1989 the EPA institutes a "phase-down" ban of all asbestos containing materials, which banned the importing and use of asbestos materials into the United States, and allowed contractors to utilize any asbestos materials in stock without ordering or acquiring any new materials. The ban now states after a ruling in 1991 from the 5th Circuit Court that asbestos containing materials can be used in materials that were in existence prior to the 1989 ban, as long as they are in a non-friable form.

Certain friable materials, such as ceiling tiles are very likely to have been changed out several times since the construction of the building. Therefore, the materials present today are unlikely to contain asbestos. Roofing, floor tile and its mastic, on the other hand, are less likely to have been removed. Instead, these materials are commonly covered over with carpet or with another layer of tile. So identifying and sampling floor covering was a primary, but not exclusive, focus of this investigation. The survey also attempted to identify all friable forms of ACM, which is usually associated with heating systems and with fireproofing, such as spray-applied fireproofing.

2. Methods and Materials

Samples of suspect materials were collected in accordance with the United States Environmental Protection Agency's "Guide for Controlling Asbestos Materials in Buildings" (Purple Book 560/6-85-024, June 1985) and EPA Asbestos in Buildings "Simplified Sampling Scheme for Surfacing Materials" (Pink Book 1985 560/5-85-030A). A detailed description of the sampling methodology employed follows.

Suspect materials were noted, along with their description and quantity. Inspections were made above ceiling tiles in key areas to check for piping with thermal insulation. The suspect materials, found in each room or area, were then grouped by homogeneous materials. They were deemed homogeneous if color, date of application, location and texture were judged to be identical. A sufficient number of samples were then collected from each homogeneous material to make a definitive determination of its asbestos content.

The number of samples collected from each homogeneous area is based on the type of material and size of the sampled area. At least three bulk samples are collected from each homogeneous surfacing material, or thermal system insulation. The number of samples of non-friable miscellaneous materials is left up to the discretion of the investigator, as outlined in AHERA (40 CFR Part 763, Subpart E). In some cases, samples of a suspect material were not taken because no hidden areas could be found, or where the quantity of suspect material was less than 160 square feet.

Bulk samples were then transported to ATC Associates (NVLAP License #101187 and ELAP License #10879), which is located at 104 East 25th Street in New York City, New York, under chain of custody. Samples were analyzed by phase light microscopy ("PLM") via Method 40 CFR 763, Subpart F, Appendix A and EPA Method 600/M-4-82-020, and ELAP Analysis Protocols 198.1/198.4. Since PLM analysis of non-friable organically bound ("NOB") materials, is not consistently reliable for a negative determination of the presence of asbestos, all NOB samples that were negative under PLM analysis were then subjected to transmission electron microscopy ("TEM"). TEM analysis was conducted via EPA Method 600/R-93/116.

3. Results

The survey was conducted on January 21, 2005, at the time of the survey a copy of analytical results from a survey completed by Anthony Genaro, PE on February 19, 2004 was given to CNS. Suspect materials are listed in the table below, along with quantity and analysis results. Materials that were sampled by others are also listed in the table. A sketch of the survey area that indicates the names and locations of the areas described in the table is also attached.

Survey Results Summary Table

Material	Location	Quantity (ft ²)	No. of Samples/ Content % Chrysotile
Window Glazing/Caulk	1 st Floor	-	3/ND ⁽¹⁾
Wall Plaster	2 nd Floor - Office Area	-	3/ND
Black Weatherproofing (Black)	2 nd Floor Parking Garage	-	2/ND
Cooling Tower Fill	Roof	192	3/12
Duct and Walk Tar		1,500	3/33
Asphalt Roof Membrane/Flashing		65,189	9/12
Suspect Materials sampled by Anthony Genaro, PE:			
2' x 4' Ceiling tile	1 st and 2 nd floors - Office Areas	88,252	ND
Pipe Insulation	1 st Floor	-	Positive ⁽²⁾
White 12" x 12" VFT ⁽³⁾	1 st Floor	44,126	ND
Sheetrock	1 st Floor	-	ND
Brown 9" x 9" VFT	1 st and 2 nd floors - Office Areas	88,252	Positive
Spray-on Fireproofing	1 st Floor MHR	4,264	Positive

Notes:

- (1) ND= None Detected.
- (2) VFT=Vinyl Floor Tile.
- (3) Number of Samples and Asbestos Content not represented within table provided by client.

4. Site Description - Specific

4650 Broadway is a two-story commercial office building with a basement. The building is constructed primarily with a cement foundation, beams and columns. The façade consists of brick and stone with steel casement windows with non-asbestos containing glazing and caulking. The roof consists of asbestos containing asphalt sheeting (3" thick) and asbestos containing tar which is trawled onto duct work, bulkheads and parapet walls. There is two Air Handling Units with associated ductwork that has asbestos containing tar trawled onto its surfaces. Enclosed within a two-foot brick wall, within the center of the roof area, there are three Marley cooling towers, with asbestos containing fill and drift eliminator, and asbestos containing pipe insulation, associated with the air conditioning system for the building. See Drawing # AS 3 within Appendix Section A.

The New York City Department of Human Resources Administration (Dyckman Job Center) occupies a total of 88,252 square feet of office space on the first and second floors. Building materials observed consisted of an acoustical ceiling tile system with 2' x 4' ceiling tiles. Interior partitions consisted of wallboard and metal demised one-foot above the drop ceiling. As noted, the structural decking, beams and columns consisted of cement with exception to a 4,264 square foot section on the south side of the first floor, observed within the mechanical equipment room, where asbestos containing spray-on fireproofing was applied on the beams and columns. Pipe insulations observed within the mechanical equipment rooms and above ceilings consisted of fiberglass and asbestos containing air-cell. Note: the asbestos containing pipe insulation is assumed to be enclosed within wet columns throughout the first and second floors. There is brown asbestos containing 9" x 9" vinyl floor tile throughout the first and second floors, the first floor contained a layer of white non-asbestos containing 12" x 12" vinyl floor tile over the said 9" x 9" vinyl floor tiles. These tiles are fastened to the cement slab with asbestos containing (black) mastic.

Ideal Parking Corp. occupies a total of 107,315 square feet of space of the southeast portions of the first and second floors and occupies the entire basement. The decking and floors were exposed and consisted of bare cement with exception to the second floor where a black non-asbestos containing weatherproofing was applied onto the deck and the walls of the first floor. Throughout the basement there is 5,010 linear feet of asbestos containing pipe insulation.

The boiler room, which has a street access on the first floor, consisted of fiberglass insulation on the piping and flues. There are three boilers one boiler is insulated with fiberglass; the other two are insulated with asbestos containing insulation.

5. Recommendations and Asbestos Removal Estimates

As noted, asbestos is present within the floor tile, floor tile mastic, pipe insulation, spray-on fireproofing, roofing materials, duct tar and roof mounted cooling tower Fill and Drift Eliminator. These materials only need to be removed if impacted by a renovation and can be managed in-place with an Operations and Maintenance Program. The cost to remove the identified asbestos containing materials is outlined in the table below.

Non-Union Contractor

4650 Broadway, New York City, NY

Floor tile with associated mastic - 1st and 2nd floors	88,252 SF	\$2.45 /SF	=	\$216,217.40
Spray-on Fireproofing - 1st Floor	4,264 SF	\$6.35 /SF	=	\$27,076.40
Pipe Insulation - 1st and 2nd floors	1,500 LF	\$8.50 /LF	=	\$12,750.00
Boiler Room - 1st Floor	1,260 SF	\$12.00 /SF	=	\$15,120.00
Pipe insulation - Basement	5,010 LF	\$11.25 /SF	=	\$56,362.50
Roof Membrane and Flashing	65,189 SF	\$3.35 /SF	=	\$218,383.15
Wall and Duct Tar - Roof	1,500 SF	\$6.25 /SF	=	\$9,375.00
Cooling Tower Fill - Roof	192 SF	\$15.10 /SF	=	\$2,899.20
	Total		=	\$558,183.65

Union Contractor

4650 Broadway, New York City, NY

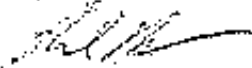

Floor tile with associated mastic - 1st and 2nd floors	88,252 SF	\$4.25 /SF	=	\$375,071.00
Spray-on Fireproofing - 1st Floor	4,264 SF	\$8.35 /SF	=	\$35,604.40
Pipe Insulation - 1st and 2nd floors	1,500 LF	\$12.75 /LF	=	\$19,125.00
Boiler Room - 1st Floor	1,260 SF	\$14.00 /SF	=	\$17,640.00
Pipe insulation - Basement	5,010 LF	\$12.50 /SF	=	\$62,625.00
Roof Membrane and Flashing	65,189 SF	\$4.75 /SF	=	\$309,647.75
Wall and Duct Tar - Roof	1,500 SF	\$12.00 /SF	=	\$18,000.00
Cooling Tower Fill - Roof	192 SF	\$18.30 /SF	=	\$3,513.60
	Total		=	\$941,226.75

The removal project needs to be completed by a NYSDOL Certified Asbestos Contractor with NYCDEP Certified Supervisors and Handlers. The project will require filing with the NYCDEP utilizing a variance for the floor tile, cooling tower fill and pipe insulation.

1.0 INTRODUCTION

CNS Management Corp. (CNS) was retained by Acadia Realty Trust to conduct a Limited Phase II Subsurface Investigation at 4650 Broadway, in the city of New York, New York; referred to hereafter as the subject site; in compliance with New York State Department of Environmental Conservation (NYSDEC) "Spill Guidance Manual - Site Investigation Procedures" and draft document "DER-10 - Technical Guidance for Site Investigation and Remediation (12/02).

Based upon the review of a Phase I Environmental Site Assessment completed by Soil Mechanics Environmental Services and given the potential of soil and/or groundwater contamination at this location, CNS performed the limited subsurface investigation as due diligence, in response to a property acquisition.

The subject site consists of approximately 0.9 acres and is a two story commercial building with a full basement, bounded by Residential Apartments/1st Floor Commercial Businesses to the North and East, Sherman Avenue to the South and Broadway/Fort Tyron Park to the West. The subject site is currently utilized by the New York City Department of Welfare and the Ideal Parking Corp., a parking garage facility. See Figure 1: Site Plan.

2.0 BACKGROUND

CNS received a Phase I Environmental Site Assessment compiled by Soil Mechanics Environmental Services dated February 2003 for the subject site. Below is a brief summary of the report.

Phase I Environmental Site Assessment compiled by Soil Mechanics Environmental Services

The Phase I Environmental Site Assessment compiled by Soil Mechanics Environmental Services stated that the subject property was developed in 1928 on vacant land. The subject site is currently utilized by the New York City Department of Welfare and a parking garage facility. Previous to the above tenants, an auto sales and service business occupied the subject site until approximately 1950-1960. Soil Mechanics Environmental Services indicated that there is currently one (1) Aboveground Storage Tank (AST) containing #4 fuel oil located in the basement boiler room. In addition to the above listed AST, five (5) Underground Storage Tanks have been removed/abandoned at the subject site. A table of the AST and USTs is presented below.

Type of Tank	Status	Capacity	Material
AST	Active	5,000 gallon	#4 Fuel Oil
UST	Removed (9-1-98)	5,000 gallon	#4 Fuel Oil
UST	Removed (9-1-98)	2,500 gallon	#4 Fuel Oil
UST	Closed in place (1983)	550 gallon	Gasoline
UST	Closed in place (1983)	550 gallon	Gasoline
UST	Closed in place (1983)	550 gallon	Gasoline

Soil Mechanics Environmental Services stated that the affidavit relating to the closed/abandoned Gasoline USTs indicated that the gasoline was removed and the USTs were filled with concrete along with all lines except vents.

Spillage and oil-like staining was observed by Soil Mechanics Environmental Services in the boiler room adjacent to the AST, boilers and floor drains. This boiler room was observed to contain a total of three (3) boiler units, one (1) 5000 Gallon AST, an oil sump pit and pump and numerous containers of waste oil. Furthermore, staining was observed throughout the parking garage area due to general automobile activities.

The subject site was listed in the environmental database report under registered USTs and ASTs. It was indicated in the UST database that two (2) USTs were closed/removed on September 1, 1998 and the AST database listed the current 5000 Gallon #4 fuel oil AST, installed on October 1, 1998.

Soil Mechanics Environmental Services concluded that with respect to the historical uses of the subject property and the suspect/former USTs, a Phase II Subsurface Investigation is warranted.

CNS noted that the installation date of these gasoline USTs was in 1939 and 1941, indicating that the previous auto sales and service business utilized these USTs for the companies business. After interviewing personnel at the subject site, it is not known whether the current tenants also utilized these former gasoline USTs before they were closed/abandoned.

3.0 GEOLOGY / HYDROGEOLOGY

Based on site observations, the site topography is gently sloping from the West towards the East. The subject site is 100% urban. Groundwater flow is assumed to follow the topography of the subject site towards the East. A large rocky outcrop was observed in Fort Tyron Park located adjacent to the subject site to the West, also supporting regional groundwater flow towards the East.

Based on observations made during the collection of subsurface borings, the soil stratum generally consisted of concrete atop of brown fine sand, brown loamy sand and brown sandy loam to boring endpoints. Petroleum stains and odors were noted in soil boring SB-01. Boring endpoints were observed at various depths ranging from 2 to 18 feet below the ground surface (bgs). Saturated soil was encountered in soil borings SB-01 and SB-05 at a depth of 5.5 feet bgs. Groundwater was also encountered in soil borings SB-01 and SB-05 at a depth of 6 feet bgs. See Appendix A for the Soil Boring Logs.

4.0 FIELD ACTIVITIES

On Friday, January 21st and Tuesday, January 25th, 2004, CNS completed a total of five (5) subsurface borings (SB-01 through SB-05) at the subject site in the vicinity of the boiler room which contains active boilers and a 5000 Gallon AST (See Figure 1; Site Map). The drilling was completed by Soil Mechanics Environmental Services utilizing mobile split spoon methods. The ambient temperature was 15°F and the skies were cloudy. A total of five (5) soil samples were obtained from borings SB-01, SB-02, SB-04 and SB-05 at depths ranging from 3 to 15 feet below ground surface. A groundwater sample was only collected in SB-05 by CNS at the subject site due to the lack of groundwater present in SB-02, SB-03 and SB-04. Although groundwater was detected in soil boring SB-01, due to the very slow recharge rate and viscosity of the groundwater, not enough groundwater could be extracted to obtain a sample. See Appendix A for Soil Boring Logs.

All of the collected soil samples were placed in laboratory-supplied glassware, packed in ice-filled coolers accompanied by chain-of-custody documentation and transported to Analytix Corporation located at 8040 Villa Park Drive, Richmond, Virginia.

The collected soil and groundwater samples were analyzed for Volatile Organic Compounds (VOCs) and Semi-Volatile Organic Compounds (SVOCs) in accordance with USEPA Methods 8260 and 8270 respectively. The analytical results were compared to the NYSDEC TAGM #4046 Allowable Soil Concentration and Recommended Soil Cleanup Objectives as outlined in Tables 1 and 2.

5.0 ANALYTICAL RESULTS

Soil Sample Results

Soil samples were collected from borings SB-01, SB-02, SB-04 and SB-05. Analytical results identified VOC contaminants above NYSDEC's TAGM #4046 Allowable Soil Concentration and Recommended Soil Cleanup Objectives. Analytical results did not identify any SVOC contamination at the subject site. A summary of the VOC contaminants above NYSDEC TAGM #4046 Allowable Soil Concentration and Recommended Soil Cleanup Objectives are presented below.

Analyte	Contaminant	SB-01A 4-7' (ppm)	SB-01B 15-18' (ppm)	SB-02A 8-10' (ppm)	SB-04A 6-8' (ppm)	SB-05A 6-10' (ppm)	NYSDEC #4046 Allowable soil Concentration (ppm)	NYSDEC #4046 Rec. Cleanup Objective (ppm)
VOC	1,2,4-Trinitrobenzene	0.05	36.8	ND	ND	ND	0.15	10
	1,3,5-Trinitrobenzene	2.01	73	ND	ND	ND	0.031	3.3
	Ethylbenzene	1.35	2.52	ND	ND	ND	0.055	5.5
	Isopropylbenzene	0.22	1.40	ND	ND	ND	0.022	2.5
	M,P-Xylene	4.49	6.98	ND	ND	ND	0.012	1.2
	N-Toluene	ND	3.05	ND	ND	ND	0.15	16
	N-Propylbenzene	0.66	4.53	ND	ND	ND	0.0057	3.7
	Naphthalene	1	2.08	ND	ND	ND	0.33	13
	Diisopropylbenzene	0.19	3.4	ND	ND	ND	0.31	10

See Tables 1 and 2 for USEPA 8260 and 8270 analytical results.

Groundwater Sample Results

A groundwater sample was collected only from boring SB-05 due to the lack of groundwater present in borings SB-01 through SB-04. Analytical results identified only Acetone, a common laboratory artifact, above the measured detection limit and below the NYSDEC's Groundwater Standards. A summary of the VOC contaminants above the measured detection limits are presented below.

Analyte	Contaminant	SB-05A (ppm)	NYSDEC #4046 Groundwater Standards (ppm)
VOC	Acetone	6.83	50

See Tables 1 and 2 for USEPA 8260 and 8270 analytical results.

6.0 CONCLUSIONS AND RECOMMENDATIONS

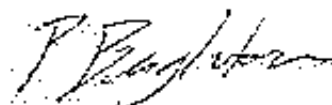

As indicated herein, soil analytical results did not identify any SVOC contamination at the subject site, which is associated with fuel oil; however VOC contamination was detected above the NYSDEC's TAGM #4046 Allowable Soil Concentration and Recommended Soil Cleanup Objectives in soil boring SB-01, therefore it can be concluded that the soil contamination is emanating from a source of gasoline range organics.

As mentioned herein, the Phase I Environmental Site Assessment completed by Soil Mechanics Environmental Services; three (3) 550 Gallon Gasoline UST's were installed in 1939-1941 and closed in place in 1983. Based on the sample results CNS Management Corp. recommends that the closed/abandoned UST's be located with a Ground Penetrating Radar in the vicinity of the boring SB-01 and within the boiler room to determine if these closed/abandoned UST's are presently contributing to the VOC contamination. See drawing number EA2 for an assumed contamination plume.

The following types of samples were submitted for analysis on January 25, 2005

4 - Soil Sample

Attached are the results we obtained on the analysis of your samples. Any Chains-of-Custody associated with this sample group are enclosed. Also enclosed is a copy of the Sample Container Receipt Form. The Sample Container Receipt Form documents the condition of the sample upon arrival at the laboratory. The last page of this report is identified by the signature of a designated laboratory manager(s). Any reproduction of this report, except in full, is not permitted without written approval of the laboratory manager and the QA manager.

The analyses performed are based on the referenced method. For details on the analytical process refer to the Standard Operating Procedure for the referenced method. The signatures at the end of this report certify that the results are based on the referenced methods and unless otherwise noted meet the requirements of NELAP.

Unless otherwise specified all analyses of solid materials are based on dry weight.

We appreciate your confidence in allowing Analytics to be your testing laboratory. Any questions regarding this report can be addressed by calling our client services department (800-888-8061).

Thank you for your business.

025-092-001 and -002 analyzed by Method 8260 had recoveries for dibromofluoromethane below QC limits.

The matrix spike analyzed by Method 8260 had recovery for the following compounds below QC limits: Benzene, Toluene, and Chlorobenzene.

The matrix spike duplicate analyzed by Method 8260 had recovery for Toluene and Chlorobenzene below QC limits.

Report Limit=PQL=Practical Quantitation Limit; DL=Lowest reportable value.

Abbreviations: ug/L = micrograms per liter, mg/L = milligrams per liter, ug/g = micrograms per gram, mg/kg = milligrams per kilogram, ug/wp = ug/wipe, ug/ml = micrograms per milliliter, PQL = Practical Quantitation Limit, S = microsiemens/centimeter at 25 degrees Celsius, ppb = parts per billion.

The following types of samples were submitted for analysis on February 01, 2005

1 - Soil Sample; 1 - Water

Attached are the results we obtained on the analysis of your samples. Any Chains-of-Custody associated with this sample group are enclosed. Also enclosed is a copy of the Sample Container Receipt Form. The Sample Container Receipt Form documents the condition of the sample upon arrival at the laboratory. The last page of this report is identified by the signature of a designated laboratory manager(s). Any reproduction of this report, except in full, is not permitted without written approval of the laboratory manager and the QA manager.

The analyses performed are based on the referenced method. For details on the analytical process refer to the Standard Operating Procedure for the referenced method. The signatures at the end of this report certify that the results are based on the referenced methods and unless otherwise noted meet the requirements of NELAP.

Unless otherwise specified all analyses of solid materials are based on dry weight.

We appreciate your confidence in allowing Analytics to be your testing laboratory. Any questions regarding this report can be addressed by calling our client services department (800-888-8061).

Thank you for your business.

032-013-002 analyzed by Method 8260 had a pH of 7.50.

The matrix spike/duplicate samples analyzed by method 8270 recovered below the QC limits for 1,4-Dichlorobenzene and 1,2,4-Trichlorobenzene. The laboratory control sample had recovery of these compounds within QC limits.

The laboratory control sample analyzed by method 8270 had recovery of 4-Nitrophenol below QC limits.

Report Limit=PQL=Practical Quantitation Limit; DL=Lowest reportable value

Abbreviations: ug/L = micrograms per liter, mg/L = milligrams per liter, ug/g = micrograms per gram, mg/kg = milligrams per kilogram, ug/wp = ug/wipe, ug/ml = micrograms per milliliter, PQL = Practical Quantitation Limit, S = microsiemens/centimeter at 25 degrees Celsius, ppb = parts per billion.

Re: Petroleum Bulk Storage (PBS) Registration
Site: 4650 Broadway (Sherman Ave), New York, New York
CNS Job #: E25463

Dear Mr. Scholes:

On Thursday September 8th, 2005, CNS Management Corp. (CNS) successfully updated the status of the 5,000 gallon Aboveground Storage Tank (AST) at the above subject site to comply with the New York State Department of Environmental Conservation's (NYSDEC) 6 NYCRR Part 612: Registration of Petroleum Storage Facilities.

This update involved the submittal of the Petroleum Bulk Storage Application regarding the change of ownership status at the subject site and the posting of the Petroleum Bulk Storage Certificate at the premises. See Appendix A: NYSDEC Documents.

Additionally the New York City Fire Department (NYCFD) was contacted and on August 17th, 2005, NYCFD Inspector Talsio John successfully inspected and updated the AST at the subject site to comply with the Rules of the City of New York, Title 3 Section 20-08. However at the time of inspection, Inspector John indicated that there were existing violations to the previous operator, Berman Operating Corp, for the removal of two (2) previous ASTs and the installation of the current 5,000 gallon AST. Inspector John of the NYCFD issued a Violation Order (E144621). This Violation Order will need to be addressed by providing the NYCFD with a copy of the affidavits regarding the removal of the previous ASTs and a New York City Department of Buildings "Certificate of Approval" for the use and storage of fuel oil. See Appendix B: NYCFD Violation.

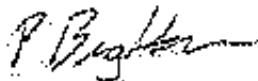

As per the NYSDEC's 6 NYCRR Part 613.6: *Handling and Storage of Petroleum - AST Inspections*, the owner or operator at the subject site must inspect the AST on a monthly basis, inspecting an AST involves checking the exterior surfaces of the tank, structural supports, piping, leak detection systems and valves for leaks, cracks or any deficiencies. The inspections need to be documented and include the following:

- Facility ID number
- AST number
- Date
- Findings of the inspection and details of the repairs, if any
- A statement that the inspection was conducted in accordance with the requirements in Section 613.6 of the NYSDEC's *Handling and Storage of Petroleum - AST Inspections*.
- Address of the inspector
- Signature of Inspector

All inspection documentation must remain on-site for a period of 10 years.

If you have any questions or require any additional information please call me at (316) 932-3228.

Sincerely,

Peter Brighton
Environmental Engineer

FO-4 VIOLATION ORDER SUPPLEMENT

Account # 11337677

Date 08/17/05

VO# 144621

As stated in the violation order we need an affidavit. The affidavit must include the following information:

- * Must be on business letterhead and notarized.
- * Must contain the name of the licensee sealing and/or removing the tank(s).
- * The type of license, license number, and the expiration date of such license.
- * The number, location and size of tanks.
- * The type of product removed.
- * State whether the system is a Permanent or Temporary seal.
- * *The affidavit shall specifically state whether the storage system was sealed and/or removed in accordance with the guidelines described in section (c) or (d) of Title 3, RCNY Chapter 21-02.*

[§613.8 Reporting of spills and discharges](#)

[§613.9 Closure of out-of-service tanks](#)

[Back to top of page](#)

§613.1 General

(a) Purpose. The purpose of this Part is to set forth regulations for the handling and storage of petroleum in order to protect the public health, welfare and the lands and waters of the State.

(b) Applicability. This Part applies to all aboveground and underground petroleum storage facilities with a combined storage capacity of over eleven-hundred (1,100) gallons including all facilities registered under Part 612 of this Title. This Part also applies to those facilities licensed under Article 12 of the Navigation Law to the extent provided in Part 610. This Part does not apply to

oil production facilities and facilities regulated under the Federal Natural Gas Act.

(c) Definitions. The definitions found in subdivision 612.1(c) of this Title shall apply to this Part.

(d) Severability. If any provisions of this Part or its application to any person or circumstance is held to be invalid, the remainder of this Part and the application of that provision to other persons or circumstances will not be affected.

(e) Access to records and facilities.

(1) Upon reasonable notice of the commissioner or his designee, the owner or operator must allow any designated officer or employee of the Department at all reasonable times to review and to copy any books, papers, documents and records relating to recordkeeping requirements and compliance with this Part.

(2) Any designated officer or employee of the Department may, at reasonable times and upon reasonable notice, enter and inspect a facility for compliance with this Part, provided that the officer or employee is accompanied by the owner, operator or their designee.

(f) Enforcement. Any person who violates any of the provisions of this Part, or any order issued by the commissioner, shall be liable for the civil, administrative and criminal penalties set forth in Article 71 of the Environmental Conservation Law.

(g) Referenced materials. Citations used in this Part refer to the publications listed below. These publications are available for copying and inspection at the Department of Environmental Conservation, Division of Water, 50 Wolf Road, Albany, New York.

(1) "NFPA No. 30" means National Fire Protection Association, *Flammable and Combustible Liquids Code, No. 30* July 5, 1984, NFPA, Batterymarch Park, Quincy, Massachusetts, 02269, Pages 30-14, 30-15, 30-17, 30-20, 30-21.

(2) "NFPA No. 30A" means National Fire Protection Association, *Automotive and Marine Service Station Code, No. 30A*, July 5, 1984, NFPA, Batterymarch Park, Quincy, Massachusetts, 02269, Pages 30A-7 and 30A-8.

[Back to top of page](#)

§613.2 Bulk storage in flood plains

facility in a flood plain as defined in Part 500 of this Title must be safeguarded against buoyancy and lateral movement by flood guards in accordance with operating standards set forth in NFPA 30, section 2-5.6 (see subdivision 613.1(g)), and in accordance with State and local flood plain regulations. If such guards include ballasting of tanks with water during flooding periods, tank valves and other openings must be closed and secured in a locked position in advance of the flood. Ballast water removed from the tank after the flood must not be discharged to the waters of the State if the discharge would contravene the standards of Parts 701, 702 or 703 of this Title.

[back to top of page](#)

§613.3 Overfill prevention and secondary containment systems

(a) **Responsibility for transfer.** The operator, when on the premises or when in control of a petroleum transfer, shall be responsible for transfer activities. If the operator is not on the premises or not in control of a petroleum transfer, the carrier will be responsible for transfer activities. The operator or carrier will employ practices for preventing transfer spills and accidental discharges. Prior to the transfer, the operator or carrier must determine that the receiving tank has available capacity to receive the volume of petroleum to be transferred. The operator or carrier must monitor every aspect of the delivery and must take immediate action to stop the flow of petroleum when the working capacity of the tank has been reached or should an equipment failure or emergency occur.

(b) Color coding of fill ports.

(1) Beginning five (5) years from the effective date of these regulations, the owner or operator must permanently mark all fill ports to identify the product inside the tank. These markings must be consistent with the color and symbol code of the American Petroleum Institute which follows.

(2) The colors to be used are:

(i)	High gasoline	Red
(ii)	Middle gasoline	Blue
(iii)	Lower gasoline	White
(iv)	High unleaded gasoline	Red w/white cross

	Middle unleaded gasoline	Blue w/white cross
	Lower unleaded gasoline	White w/black cross
i)	Vapor recovery	Orange
ii)	Diesel	Yellow
x)	#1 fuel oil	Purple w/yellow bar
x)	#2 fuel oil	Green
xi)	Kerosene	Brown

(3) The symbols to be used are:

- (i) a circle for gasoline products and vapor recovery lines;
- (ii) hexagon for other distillates; and
- (iii) a border must be painted around fuel products containing extenders such as alcohol. The border will be black around a white symbol and white around all other colors.

(4) Monitoring wells must be permanently marked and identified as a "monitoring well".

(c) Requirements for valves, gauges and secondary containment systems. Within five (5) years of the effective date of these regulations, the owner must install the following:

(1) Shutoff valves for remote pumping units at motor fuel dispensers. All dispensers of motor fuel under pressure from a remote pumping system must be equipped with a shear valve (Impact valve) which is located in the supply line at the inlet of the dispenser. This valve must be designed to close automatically in the event that the dispenser is accidentally dislodged from the inlet pipe. A valve meeting the standards set forth in NFPA No. 30A, section 4-3.6 (see subdivision 613.1(g)) meets the requirements of this subdivision.

(2) Shutoff valves for gravity-fed motor fuel dispensers. All tanks which cause a gravity head on a dispenser of motor fuels must be equipped with a device such as a solenoid valve which is positioned adjacent to and downstream from the operating valve required in paragraph 613.3(c)(5). The valve must be installed and adjusted so that liquid cannot flow by gravity from the tank in case of piping or dispenser hose failure. A valve meeting the standards set forth in NFPA 30A, section 2-1.7 (see subdivision 613.1(g)) meets the requirements of this

subdivision.

(3) Gauges for aboveground storage tanks

(i) All aboveground petroleum tanks must be equipped with a gauge which accurately shows the level of product in the tank. The gauge must be accessible to the carrier and be installed so it can be conveniently read.

(ii) The design capacity, working capacity and identification number of the tank must be clearly marked on the tank and at the gauge.

(iii) A high level warning alarm, a high level liquid pump cutoff controller or equivalent device may be used in lieu of the gauge required above.

(4) Check valve for pump-filled tanks. All fill pipes leading to a pump-filled petroleum tank must be equipped with a properly functioning check valve or equivalent device which provides automatic protection against backflow. A check valve is required only when the piping arrangement of the fill pipe is such that backflow from the receiving tank is possible.

(5) Operating valves for gravity-drained tank. Each tanks connection through which petroleum can normally flow must be equipped with an operating valve to control the flow. A valve which meets the standards set forth in NFPA No. 30, section 2-2.71.1 (see subdivision 613.1(g)) meets the requirements of this paragraph.

(6) Secondary containment system for aboveground tanks.

(i) A secondary containment system must be installed around any aboveground petroleum storage tank which:

(a) could reasonably be expected to discharge petroleum to the waters of the state, or

(b) which has a capacity of ten thousand (10,000) gallons or more. The secondary containment system must be constructed so that spills of petroleum and chemical components of petroleum will not permeate, drain, infiltrate or otherwise escape to the groundwaters or surface waters before cleanup occurs. The secondary containment system may consist of a combination of dikes, liners, pads, ponds, impoundments, curbs, ditches, sumps, receiving tanks and other equipment capable of containing the

product stored. Construction of diking and the storage capacity of the diked area must be in accordance with NFPA No. 30, section 2-2.3.3 (see subdivision 613.1.(g)).

(ii) If soil is used for the secondary containment system, it must be of such character that any spill onto the soil will be readily recoverable and will result in a minimal amount of soil contamination.

(iii) Storm water which collects within the secondary containment system must be controlled by a manually operated pump or siphon, or a gravity drain pipe which has two manually controlled dike valves, one on each side of the dike. All pumps, siphons and valves must be properly maintained and kept in good condition. If gravity drain pipes are used, all dike valves must be locked in a closed position except when the operator is in the process of draining clean water from the diked area.

(iv) Storm water or any other discharge at a facility must be uncontaminated and free of sheen prior to discharge. Storm water which is contaminated must be treated to reduce petroleum concentration to 15 parts per million or less and to remove any visible sheen prior to discharge. Additional requirements may be imposed under 6 NYCRR Parts 751-758 for protection of the state's waters.

(d) Maintenance of spill prevention equipment. The owner or operator must keep all gauges, valves and other equipment for spill prevention in good working order.

[Back to top of page](#)

§613.4 Inventory monitoring for underground storage facilities

(a) Inventory records

(1) The operator of an underground storage tank must keep daily inventory records for the purpose of detecting leaks. Records must be kept for each tank (or battery of tanks if they are interconnected) and shall include measurements of bottom water levels, sales, use, deliveries, inventory on hand and losses or gains. Reconciliation of records must be kept current, must account for all variables which could affect an apparent loss or gain and must be in accordance with generally accepted practices.

(2) If the tank is unmetered or if the tank contains petroleum for consumptive use on the premises where stored, the operator may detect inventory leakage in an alternative method to paragraph 613.4(a)(1) above. This may include an annual standpipe analysis or other method acceptable to the Department.

(b) Exemptions. No inventory monitoring is required:

- (1) for an underground tank storing No. 5 or No. 6 fuel oil; or
- (2) where the operator can demonstrate to the satisfaction of the Department that it is technically impossible to perform inventory monitoring for the purpose of leak detection.

(c) Maintenance of inventory records

- (1) Inventory monitoring records must be maintained and made available for Department inspection for a period of not less than five (5) years.
- (2) Failure to maintain and reconcile such records constitutes cause for Department-ordered tests and inspections of the facility at operator expense as set forth in section 613.7.

(d) Reporting of inventory losses. If inventory monitoring required in subdivision 613.4(a) shows: an inventory loss; a recurring accumulation of water in the bottom of the tank during any ten-day period; apparent product losses or gains exceed three-quarters (3/4) of one (1) percent of the tank volume; or apparent losses or gains exceed seven and one-half (7.5) gallons per one-thousand (1,000) gallons delivered, the operator must initiate an investigation into the possible causes. If, within forty-eight (48) hours, the causes cannot be explained by inaccurate recordkeeping, temperature variations or other factors not related to leakage, the operator must notify the owner and the nearest regional office of the Department and must take the tank out-of-service in accordance with subdivision 613.9(a) until such cause is determined and necessary repairs or replacements are made.

[Back to top of page](#)

§613.5 Underground storage facilities - testing and monitoring

(a) Periodic tightness testing.

(1) Testing schedule

(i) The owner of any underground petroleum storage tank and connecting piping system must have the tank and pipes periodically tested for tightness as shown in Table 1, below.

(ii) Any tank and piping system which is due for an initial test within the first year of the effective date of these regulations or any tank which is of unknown age must be tested within (2) years of the effective date of these regulations.

(iii) If the tank and piping system is due for an initial test but has been tested within a five (5) year period prior to the due date in a manner consistent with criteria set forth in paragraph 613.5(a)(6), the Department may accept this test as the initial test. The test report must be sent to the Department prior to the due date for the initial test.

(iv) Retesting of all tank and piping systems must be completed no later than every five (5) years from the date of the previous test.

(v) If for any reason, testing or inspection is not performed as required in this section, the tank or piping system must be replaced in accordance with sections 614.2 through 614.5 inclusive, 614.7 and 614.14 of this Title or taken out-of-service pursuant to the requirements of section 613.9.

Table 1

Testing Schedule-Underground Tanks

Category A Tank	Unprotected tank	Initial test when the tank is (10) years old. Retested every five (5) years thereafter until permanently closed.
Category B Tank	Corrosion-resistant tank	Initial test when the tank is fifteen (15) years old.

Category C Tank	Corrosion-resistant tank and pipe which have a leak monitoring system or any new tank and pipe installed in conformance with Part 614 of this Title.	Monitoring in accordance with paragraph 613.5(b)(3). No periodic testing is required.
--------------------	--	--

(2) Exemptions. No periodic tightness test is required:

- (i) on a tank and piping system storing No. 5 or No. 6 fuel oil;
- (ii) on a tank and piping system which has a capacity of eleven hundred (1,100) gallons or less unless the Department determines that the tank or piping system could reasonably be expected to leak petroleum to the waters of the State;
- (iii) on tanks and piping systems which are corrosion resistant and have a leak monitoring system;
- (iv) on tanks and piping systems installed in conformance with the standards for new construction set forth in Part 614 of this Title; or
- (v) where the size of the tank exceeds 50,000 gallons or where it is technically impossible to perform a meaningful tightness test. In this case, an alternative test or inspection which is acceptable to the Department must be conducted.

(3) Qualifications of test technicians. All tightness tests must be performed by a technician who has an understanding of variables which affect the test, is trained in the performance of the test and meets the qualifications set forth by the Department.

(4) Test reports (i) A test report must be sent by the owner or technician to the Department no later than thirty (30) days after performance of the test, except any test or inspection which shows the facility is leaking must be reported by any person with knowledge of such leak to the Department within two (2) hours of the discovery of such leak. Notification must be made by calling the telephone hotline (518) 457-7362.

(ii) All test reports must be in a form satisfactory to the Department and must include the following information:

- (a) facility registration number,
- (b) identification number used on the application form required in subdivision 612.2(f) of this Title for tank and piping system tested,
- (c) date of test,
- (d) results of test,
- (e) test method,
- (f) certification by the technician that test complies with criteria for a tightness test in paragraph 613.5(a)(6),
- (g) statement of technician's qualifications,
- (h) address of technician, and
- (i) signature of technician.

(iii) A copy of the test report(s) must be maintained by the owner of the facility for a least five (5) years.

(5) Repair, replacement and closure of leaking systems. Any part of the storage facility which is not tight must be promptly emptied, replaced or repaired in accordance with Part 614 of this Title or taken out-of-service in accordance with section 613.9.

(6) Criteria for tightness test. A tightness test is a test acceptable to the Department which will determine if a tank and piping system is tight or not tight. The test must be capable of detecting a tank or piping leak as small as five-hundredths (0.05) of a gallon in one-hour accounting for variables such as vapor pockets, thermal expansion of product, temperature stratification, groundwater level, evaporation, pressure and end deflection.

(b) Monitoring of corrosion-resistant tanks and pipes.

(1) The owner or operator of any corrosion-resistant underground tank or pipe which is exempt from tightness testing under subparagraph 613.5(a)(2)(iii), must monitor all cathodic protection and leak detection systems.

(2) The adequacy of a cathodic protection system must be monitored at least annually. If at any time the system fails to

provide the necessary electrical current to prevent corrosion, the cathodic protection system must be restored within thirty (30) days. Any tank or pipe with a non-working cathodic protection system will be considered unprotected and must be tested for tightness within one (1) year and retested every five (5) years thereafter until the tank is permanently closed.

(3) The owner or operator must monitor for traces of petroleum at least once per week. All monitoring systems must be inspected monthly. Monitoring systems must be kept in proper working order. If at any time the monitoring system fails to function effectively, it must be repaired within thirty (30) days. Any tank or piping system with a non-working monitoring system must be tested for tightness within one (1) year and retested every five (5) years thereafter until the tank is permanently closed.

(4) Monitoring records for cathodic protection and leak detection systems must be maintained on the premises for a period of at least one (1) year.

[Back to top of page.](#)

§613.6 Aboveground storage facilities - inspections

(a) Monthly inspections. The owner or operator of an aboveground storage facility must inspect the facility at least monthly. This must include:

- (1) inspecting exterior surfaces of tanks, pipes, valves and other equipment for leaks and maintenance deficiencies;
- (2) identifying cracks, areas of wear, corrosion and thinning, poor maintenance and operating practices, excessive settlement of structures, separation or swelling of tank insulation, malfunctioning equipment and structural and foundation weaknesses; and
- (3) inspecting and monitoring all leak detection systems, cathodic protection monitoring equipment, or other monitoring or warning systems which may be in place at the facility.

(b) Ten-year inspection

(1) Schedule.

- (i) In addition to monthly inspections required above, the

owner or operator must perform a detailed inspection as described in paragraph 613.6(b)(3) below, of any aboveground tank with a capacity of ten thousand (10,000) gallons or more, or any tank with a capacity less than ten thousand (10,000) gallons which could reasonably be expected to discharge petroleum to the waters of the State. The initial inspection must be performed when the tank is ten (10) years old, or within five (5) years of the effective date of these regulations, whichever comes later.

(ii) Any tank which is of an unknown age must be inspected within five (5) years of the effective date of these regulations.

(iii) If a tank is due for an initial inspection but has previously been inspected in a manner consistent with the criteria set forth in paragraph 613.6(b)(3) within a ten (10) year period prior to the due date, the Department may accept this previous inspection.

(iv) Reinspection of all tanks is required no later than ten (10) years from the date of the previous inspection.

(2) Exemptions. Ten-year inspections are not required for:

(i) tanks which are entirely aboveground, such as tanks on racks, cradles or stilts;

(ii) tanks storing No. 5 or No. 6 fuel oil; or

(iii) Tanks installed in conformance with the standards for new construction set forth in sections 614.8 through 614.11 Inclusive, of this Title.

(3) Requirements for ten-year inspections. A ten (10) year inspection must consist of a tightness of the tank and connecting underground pipes or an inspection which consists of the following:

(i) cleaning the tank and difficult to reach areas within the tank in accordance with generally accepted practices;

(ii) removal, transportation and disposal of sludge in a manner consistent with all applicable state and federal laws;

(iii) inspecting the tank shell for soundness and testing all welds and seams on the tank bottom for porosity and

tightness. The test must be consistent with generally accepted industry testing and inspection practices. This may include one or a combination of the following: a tightness test, an air pressure, hydrostatic or vacuum test, a penetrant dye test, a non-destructive test to detect thinning of the tank or hammering to detect weak areas;

(iv) visual inspection of the internal surfaces of the tank and difficult to reach areas for corrosion or failure;

(v) inspection of internal coatings for any signs of failure of the coating system such as cracks, bubbles, blisters, peeling, curling or separation; and

(vi) a tightness test of any connecting underground pipes.

(c) Inspection reports.

(1) Reports for each monthly inspection and ten-year inspection must be maintained and made available to the Department upon request for a period of at least ten (10) years.

(2) The reports must include the following information:

(i) facility registration number,

(ii) identification number for tank inspected,

(iii) date of inspection,

(iv) results of inspection including a report on the need for repair,

(v) certification by the inspector that the inspection has been performed in a manner consistent with requirements of section 613.6,

(vi) address of inspector, and

(vii) signature of inspector.

(d) Repair of equipment deficiencies. If any inspection reveals a leak, a tank or equipment deficiency, a deficiency in monitoring equipment, excessive thinning of the tank shell which would indicate structural weakness when the tank is filled with petroleum, or any other deficiency which could result in failure of the facility to function properly or store and contain the product in storage, remedial measures must be promptly taken to eliminate the leak or

deficiency.

(e) Uninspected facilities. If any portion of a facility is not inspected as required, the uninspected portion of the facility must be taken out-of-service pursuant to the requirements of section 613.9.

[Back to top of page](#)

§613.7 Additional testing and inspection requirements

When a leak of petroleum is suspected or appears probable, or where tests or inspections have not been performed, or where accurate inventory records are not kept and reconciled as required in section 613.4, the Department may order the owner or operator to inspect and to test the tanks or equipment for tightness and structural soundness. If the owner or operator fails to conduct such tests and inspections within ten (10) days, the Department may conduct inspections or tests for tightness or structural soundness. The expenses of conducting such tests as ordered by the Department shall be paid by the facility owner.

[Back to top of page](#)

§613.8 Reporting of spills and discharges

Any person with knowledge of a spill, leak and discharge of petroleum must report the incident to the Department within two (2) hours of discovery. The results of any inventory record, test or inspection which shows a facility is leaking must be reported to the Department within two (2) hours of the discovery. Notification must be made by calling the telephone hotline (518) 457-7362.

[Back to top of page](#)

§613.9 Closure of out-of-service tanks

(a) Closure of tanks temporarily out-of-service

(1) Storage tanks or facilities which are temporarily out-of-service for thirty (30) or more days must be closed as follows:

- (i) All products must be removed from the tank and piping system to the lowest draw-off point. Any waste product removed from the tank must be disposed of in accordance

with all applicable state and federal requirements. Tanks must be protected from floatation in accordance with good engineering practices.

(ii) All manways must be locked or bolted securely and fill lines, gauge openings or pump lines must be capped or plugged to prevent unauthorized use or tampering.

(2) Storage tanks or facilities which are temporarily out-of-service are subject to all requirements of this Part and Part 612 of this Title including, but not limited to, periodic tightness testing, inspection, registration and reporting requirements.

(b) Closure of tanks permanently out-of-service.

(1) Any tank or facility which is permanently out-of-service must comply with the following:

(i) Liquid and sludge must be removed from the tank and connecting lines. Any waste products removed must be disposed of in accordance with all applicable state and federal requirements.

(ii) The tank must be rendered free of petroleum vapors. Provisions must be made for natural breathing of the tank to ensure that the tank remains vapor free.

(iii) All connecting lines must be disconnected and removed or securely capped or plugged. Manways must be securely fastened in place.

(iv) Aboveground tanks must be stenciled with the date of permanent closure.

(v) Underground tank(s) must either be filled to capacity with a solid inert material (such as sand or concrete slurry) or removed. If an inert material is used, all voids within the tank must be filled.

(vi) Aboveground tanks must be protected from floatation in accordance with good engineering practice.

(2) Storage tanks or facilities which have not been closed pursuant to paragraph 613.9(b)(1) above, are subject to all requirements of this Part and Part 612 of this Title including but not limited to periodic tightness testing, inspection, registration and reporting requirements.

(c) Reporting of out-of-service tanks. The owner of a tank or facility which is to be permanently closed must notify the Department within thirty (30) days prior to permanent closure of the tank or facility pursuant to the requirements of subdivision 612.2(d) of this Title.

(d) Used tanks.

(1) Tanks which are removed and do not meet the standards for new tanks set forth in sections 614.3 or 614.9 cannot be reinstalled for the purpose of petroleum storage.

(2) If a tank meets the standards for new tanks, it may be reinstalled for petroleum storage if after thorough cleaning and inspection, internally and externally, it is found to be structurally sound and free of pin holes, cracks, structural damage or excessive corrosion or wear. Such tanks must be reinstalled and tested in accordance with requirements of this Part and Part 614 of this Title.

(3) If a tank is to be disposed of as junk, it must be retested for petroleum vapors, rendered vapor free if necessary, and punched with holes to make it unfit for storage of liquids.

(e) Financial assurances. Forms of surety or financial assurances may be required by the Department to ensure proper closure of facilities. The amount of such financial assurances will be set by the Department. Any requirement of financial assurances must be accompanied by a finding by the Department of the public interest and shall set forth the reasons for requiring such financial assurances.

1.0 INTRODUCTION

This Asbestos Operations and Maintenance (O&M) Program provides The Property Program Manager with guidelines for conducting maintenance activities in those building areas where asbestos-containing materials (ACM) are located throughout 4650 Broadway in New York City, New York. This program adopts regulations set forth in the Rules and Regulations of the City of New York Title 15 Chapter 1, the New York State Department of Labor Industrial Code Rule 56 (ICR56) asbestos regulations and guidelines from the United States Environmental Protection Agency (EPA) Managing Asbestos in Place - A Building Owner's Guide to an Operations and Maintenance Program for Asbestos Containing Materials, and Occupational Safety and Health Administration (OSHA) Hazardous Communication regulations.

This manual is intended to provide a basis for implementation of the O&M program based on subject site asbestos survey results, location, condition of any ACM found to exist and questionnaire findings regarding the subject site operations. These guidelines mitigate exposure to existing asbestos materials by in-house maintenance staff, outside vendors, sub-contractors or tenants who may impact the identified asbestos outlined within Appendix D.

The primary purpose of the O&M program is the protection of the health and safety of building occupants and staff through monitoring and communication of potential hazards associated with asbestos exposure. The goals of this program include the periodic monitoring of the condition of known ACM over time, the minimization of fiber release episodes by minimizing disturbance of ACM, and abatement of asbestos in accordance with Federal NESHAP regulations and the regulations enforced by the New York City Department of Environmental Protection and the New York State Department of Labor.

1.1 ASBESTOS MANAGEMENT TEAM:

CORPORATE PROGRAM MANAGER (CPM): The CPM (*Joseph Hygon*) is responsible for Operations and Maintenance Program development and implementation.

ACCOUNT EXECUTIVE: The Account Executive is responsible for communication between consultants for CNS MANAGEMENT database services and filing projects.

PROPERTY PROGRAM MANAGER (PPM): PPM (*Mr. Robert Scholten*) is responsible for daily program management at the site.

ASBESTOS CONSULTANT: CNS Management Corp. is certified to assist the CPM in the effectuation of this O&M Program. CNS Management is available to perform building surveys, assess conditions of ACM, test and monitor airborne fiber concentration levels, coordinate ACM emergency procedures, conduct asbestos awareness training, aid in the implementation of the O&M program, and provide asbestos abatement design and monitoring services, as required. CNS Management can perform training to the Property Program Manager and staff on-site employees of the owner thereby minimizing the risks caused by the presence of ACM at the subject site through proper execution of the O&M program. CNS Management will assist the CPM to establish company asbestos policies, procedures, and guidelines and the implementation and enforcement for this O&M program at the corporate level.

ASBESTOS ABATEMENT CONTRACTORS: Asbestos Abatement Contractors are responsible for all asbestos clean up, repair and abatement in accordance with all federal and New York State & New York City regulations.

Building superintendents will be directed not to engage in any activity, which will disturb ACM. Cleanup and maintenance of ACM will be conducted only by qualified and licensed asbestos abatement contractors.

Building staff will temporarily stop any activity and notify their supervisor when their work will potentially disturb ACM. The supervisor will notify CNS Management to determine the appropriate response actions.

CNS Management will coordinate all emergency response to asbestos fiber release episodes, scheduled asbestos abatement, and/or other O&M activities throughout the property.

1.2 O&M PROGRAM ELEMENTS:

In order to be effective this O&M Program requires the implementation of the following basic elements:

- Conducting surveys for ACM and removing ACM prior to any planned disturbance in accordance with Rules and Regulations of the City of New York Title 15 Chapter 1, the New York State Department of Labor (CR36 and National Emissions Standards for Hazardous Air Pollutants (NESHAPS), 40 CFR Part 61 Subpart M.
- Conducting surveys for friable ACM in currently occupied properties constructed prior to 1980 that have suspect friable ACM (for example, pipe insulation and spray applied fireproofing). Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, duct and wall tar and cooling tower fill were identified on the roof.
- Confirming the existence of ACM by testing and removing or otherwise abating the existing ACM prior to any planned disturbance (for example, pipe insulation and spray applied fireproofing). Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, duct and wall tar and cooling tower fill were identified on the roof.
- Implementing operations and maintenance ("O&M") programs in accordance with applicable laws, to manage and periodically assess the condition of ACM at the subject site where friable ACM has been identified.
- Minimizing disturbance of ACM through employee awareness training and hazard communication practices.
- Informing and notifying building staff, vendors and sub-contractors of potential hazards associated with their work activities within the subject site in accordance with applicable federal, state, and local laws and regulations. As required by OSHA 29 CFR 1926.1101, all staff persons who work in the subject site shall be trained in awareness of asbestos which includes the location, condition and general health concerns associated with asbestos exposure. In addition, all outside contractors who work in properties that contain friable ACM will be notified, in writing, by the Account Executives of ACM and made aware of their obligations to their employees.
- Superintendents, maintenance and other building staff who perform routine maintenance or custodial activities will be trained in Asbestos Awareness. CNS Management will conduct awareness seminars. They serve to expand on relevant information while allowing attendees to raise questions.
- Property Program Managers will provide notification to employees, tenants and outside contractors regarding asbestos-related repair or abatement activities occurring within the building as required by applicable laws and regulations.

1.3 EMERGENCY RESPONSE PROCEDURES:

As long as ACM is present in the property, a fiber release episode could occur if the ACM is inadvertently disturbed. Building staff will be trained to immediately report to the Program Manager the presence of suspect asbestos containing debris on the floor, water or physical damage to the ACM, or any other evidence of a fiber release. Upon notice of an ACM release episode, The Property Program Manager will conduct the following procedures:

- Evaluate the extent of ACM damage;
- Cordon contaminated areas against entry by unauthorized personnel;
- Coordinate response clean-up by certified asbestos contractor and personnel;
- Isolate the contaminated area by sealing doors and vents with polyethylene sheeting and duct tape and shutting off or modifying air handling system or any other notification appropriate to restrict access or prevent exposure in other areas of the property;
- Post a warning sign outside the contaminated area; and
- Contact CNS Management.

If significant damage or delamination of ACM has occurred, consider total removal of the ACM by a pre-approved abatement contractor in the affected areas and replacement with a non-asbestos containing material.

1.4 AREAS WITH FRIABLE ACM:

Friable ACM (for example, pipe insulation and spray applied fireproofing). Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, duct and wall air and cooling tower fill were identified on the roof.

1.5 COMMON MAINTENANCE ACTIVITIES IMPACTING ACM:

Examples of maintenance activities performed in the subject site, which may impact, suspect or confirmed ACM are listed below. Through site-specific training this work must be performed by taking the proper care and precautions, so as to not disturb the ACM.

Examples of Maintenance Activities Which May Potentially Impact ACM (Hence, all precautions must be taken so as not to disturb ACM while conducting these activities.)

- Maintaining Thermal Pipeline System; Repairing Leaking Fittings
- Removal of Overlay Carpeting; Buffing;
- Sanding, or Grinding Floor Tiles
- Duct Riser Repair or Maintenance
- Accessing Columns or Walls, Repairing Light Fixtures
- Access to Above Suspended Ceilings into plenum
- Changing Fluorescent Light Bulbs

1.6 NEW YORK STATE & NEW YORK CITY REGULATORY REQUIREMENTS:

New York City – Title 15 Chapter 1 of the Rules and Regulations of the City of New York

New York State – New York State Department of Labor Industrial Code Rule 56.

2.0 ASBESTOS MANAGEMENT TEAM

CORPORATE PROGRAM MANAGER (CPM):

The CPM (*Joseph Hogan*) has overall responsibility for Program development and implementation. Any deviation from this program must be pre-approved by the CPM.

ASBESTOS CONSULTANT:

CNS Management is used as a qualified and experienced asbestos consultant to assist the CPM and other company representatives. CNS Management is available to perform building surveys, assess conditions of ACM, test and monitor airborne fiber concentration levels, coordinate ACM emergency procedures, conduct asbestos awareness training, aid in the implementation of the O&M program, and provide asbestos abatement design and monitoring services, as required. CNS Management will train the PPM and employees and they will be responsible for minimizing the risks caused by the presence of ACM in applicable properties through proper execution of the O&M program. CNS Management will assist the CPM to establish company asbestos policies, procedures, and guidelines and the implementation and enforcement for this O&M program at the corporate level.

PROPERTY PROGRAM MANAGER (PPM):

The PPM (*Mr. Robert Scholem*) is responsible for daily Program management at the site. The PPM is designated to interact with the asbestos consultant. The PPM has the implementation responsibility for the implementation of the site-specific O&M Program. The PPM must obtain approval from the CPM to make any deviations to this program.

ASBESTOS ABATEMENT CONTRACTORS:

Asbestos Abatement Contractors are responsible for all asbestos clean up, repair and abatement in accordance with all federal, state and local regulations.

3.0 PURPOSE

The primary purpose of the O&M program is the protection of the health and safety of building occupants and maintenance staff, tenants, vendors and sub-contractors. The goals of this program include the training of house staff of the hazards to asbestos exposure, the periodic monitoring of the condition of ACM, the minimization of fiber release episodes by minimizing disturbance of ACM, and abatement of asbestos when considered necessary due to impending impact or condition of ACM. This program addresses those procedures and practices required to safely perform activities, such as:

- Monitoring of the condition of ACM;
- Performing emergency asbestos abatement; and
- Overseeing asbestos waste disposal.

This program is also designed to:

- Inform management and building staff of the presence of asbestos at the subject site and of precautions to be taken to prevent potential exposures;
- Provide proper training to building staff;
- Provide necessary safety and personal protective equipment to building staff;
- Provide proper notification to outside contractors on the presence and location of identified ACM;
- Establish schedules for periodic surveillance activities;
- Provide guidelines for response to fiber-release episodes; and
- Organize the documentation of all these activities in conformance with applicable regulations and guidelines.

4.0 OPERATIONS AND MAINTENANCE PROGRAM

CNS Management will evaluate the subject site for the purpose of developing and implementing a site specific O&M program. The building staff of the subject site will be notified of ACM presence, as required by law; and, if the ACM is not required to be removed, certain employees will be trained in awareness of asbestos hazards and how to detect and report episodic incidents of damaged ACM to allow for the proper abatement and/or safe clean-up of the ACM.

The PPM will direct all building staff not to engage in any activity, which will disturb ACM. Only qualified and licensed asbestos abatement contractors will conduct cleanup and maintenance of ACM.

Building staff will temporarily stop any activity and notify their supervisor when their work will potentially disturb ACM. The supervisor will notify CNS Management to determine the appropriate response actions.

CNS Management will coordinate all emergency response to asbestos fiber release episodes, scheduled asbestos abatement, and/or other O&M activities throughout the property.

4.1 Program Requirements

This Program requires:

- Conducting surveys for ACM and removing ACM prior to any planned disturbance in accordance with Rules and Regulations of the City of New York, Title 25 Chapter 1, the New York State Department of Labor 16SR56 and National Emissions Standards for Hazardous Air Pollutants (NESHAPS), 40 CFR Part 61 Subpart M.
- Conducting surveys for friable ACM in currently occupied properties constructed prior to 1980 that have suspect friable ACM (for example, pipe insulation and spray applied fireproofing). Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, duct and wall tar and cooling tower fill were identified on the roof.
- Confirming the existence of ACM by testing and removing or otherwise abating the existing ACM prior to any planned disturbance (for example, pipe insulation and spray applied fireproofing). Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, duct and wall tar and cooling tower fill were identified on the roof.
- Implementing an Operations and Maintenance ("O&M") program in accordance with applicable laws, to communicate hazards and periodically assess the condition of ACM in Property buildings where friable ACM has been identified.
- Minimizing disturbance of ACM through employee awareness training and other management practices.
- Informing building staff, vendors and sub-contractors in accordance with applicable federal, state, and local laws and regulations.

4.2 Planned Asbestos Work in Occupied Areas

The Asbestos Survey will be utilized to assess the condition and potential hazards posed by ACM and as may otherwise be required to determine extent of ACM impact based upon the results of said survey and arising out of and in conjunction with a planned alteration ("Planned Actionable"). The PPM will strive to abate any ACM that is damaged, accessible and friable to the extent it poses an immediate health threat ("Short-Term Actionable") in accordance with applicable laws and regulations.

Abatement will be performed by a qualified and licensed contractor pre-qualified by CNS Management, prior to or in conjunction with any emergency, renovation or demolition work, which could disturb ACM.

4.3 Periodic ACM Surveillance/Inspection

Periodic review of the O&M Program is essential to see that the program objectives are being met. *A key feature of the review is reinspection of all ACM in the property.* The reinspection combined with ongoing reports of changes in the condition of the ACM will ensure that any damage or deterioration of the ACM will be detected and corrective action taken. Reinspection will be conducted, at a minimum, annually; and more frequently where necessary, as determined by the PPM. Friable and/or deteriorated material, such as sprayed-on ACM and highly accessible ACM, may require inspections every 6 months to determine any changes in conditions.

CNS Management will conduct the reinspections as authorized by the PPM. CNS Management can develop an inspection schedule, which will be followed annually, or until such time as all asbestos materials are removed.

Forms, which can be used to document the reassessment of materials previously determined to contain asbestos, are provided. Completed forms will be retained in the site manual with other periodic surveillance materials.

4.4 Emergency Response Procedures

As long as ACM remains in the property, a fiber release episode could occur if the ACM is inadvertently disturbed. Building staff will immediately report to the PPM the presence of suspect asbestos containing debris on the floor, water or physical damage to the ACM, or any other evidence of a fiber release. The PPM will conduct the following procedures:

- Evaluate the extent of ACM damage;
- Cordoned contaminated areas against entry by unauthorized personnel;
- Coordinate response clean-up by certified asbestos contractor and personnel;
- Isolate the contaminated area by sealing doors and vents with polyethylene sheeting and duct tape and shutting off or modifying air handling system or any other notification appropriate to restrict access or prevent exposure in other areas of the property;
- Post a warning sign outside the contaminated area; and
- Contact CNS Management.

If significant damage or delamination of ACM has occurred, consider total removal of the ACM by a pre-approved abatement contractor in the affected areas and replacement with a non-asbestos containing material.

4.5 Asbestos Abatement

Abatement and disposal of ACM will be conducted in accordance with Rules and Regulations of the City of New York Title 15, Chapter 1, the New York State Department of Labor Industrial Code Rule 56 (ICR56). A third party consultant will (1) design large abatement projects, (2) observe the work quality of abatement contractors, (3) inform applicable employees of the presence of ACM prior to the abatement work being performed, (4) conduct air monitoring before, during, and after abatement projects, as appropriate, and (5) prepare and submit final abatement project reports.

Preparation of a specification or detailed scope of work will be necessary for major asbestos abatement activities. The specification shall be site-specific and detailed for a particular project or operation. Specifications will be required for all major work by abatement contractors, except for routine operations conducted under the guidance of the designated asbestos consultant. The PPM or the Account Executive will only employ qualified and licensed asbestos abatement contractors for abatement projects, independent of the asbestos consultant and the licensed laboratory.

4.6 Training

4.6.1 Training Requirements

Superintendents, maintenance and other building staff who perform routine maintenance or custodial activities that potentially disturb ACM will be trained in Asbestos Awareness. Each such employee will receive 2-hour asbestos awareness training. The training will consist of information regarding:

- Asbestos and its various uses and forms;
- Health effects associated with asbestos exposure;
- Locations of ACM identified within the building;
- Recognition of damage, deterioration, and delamination of ACM;
- The O&M program for the building; and
- Proper response to fiber release episodes.

Custodial activities may be limited to cleaning and simple maintenance tasks where ACM may have the potential to be accidentally disturbed. Generally, custodial employees will not directly contact friable ACM but must be directed to use the proper equipment when performing custodial maintenance (for example, cleaning asbestos-containing floor tile with nonabrasive brushes). They will be aware of all relevant regulations including the local, state and those of OSHA and USEPA.

When outside contractors are hired for renovation work in the building, they must be notified of the presence of asbestos, but The PPM will also oversee the work practices to ensure that the renovation activities do not result in exposures of building occupants or employees.

4.6.2 Asbestos Awareness Training

As required by OSHA, all building staff personnel who work in properties that contain friable ACM will be trained on awareness of asbestos. In addition, all outside contractors who work in properties that contain friable ACM will be notified, in writing, by the Account Executives of ACM and made aware of their hazardous communication obligation to their employees.

Program Managers will provide notification to applicable employees and outside contractors regarding asbestos-related repair or abatement activities occurring within the building, as necessary and/or as required by applicable laws and regulations.

4.6.3 Documentation of Training

Records or certificates for each employee trained must be kept on file in the site-specific O&M manual. The records will include the trainer, the date of training, and the content of the training provided. Information regarding dates and type of training per individual will be stored on a database.

4.7 Notification

4.7.1 Regulatory Notifications

The New York City Department of Environmental Protection, the New York State Department of Labor and the EPA Region 2 office must be notified in writing 10 days prior to each scheduled asbestos abatement project and within 24-hours of any emergency asbestos abatement project. The Account Executives will ensure that the consultant designing planned-project work accurately notifies the applicable agencies within the required notification period prior to initiation of work. The Account Executive will ensure that CNS Management is copied on all notifications and project documentation.

4.7.2 Employee Notification

Employers must communicate the hazards of asbestos to employees if ACM is present in their properties or if their employees will work in proximity to ACM.

4.7.3 Program for Informing Building Occupants

A notification program will be initiated. The notification program serves two primary purposes: (1) it alerts affected parties to the presence of ACM in the property, and (2) it provides basic information on avoiding the unnecessary disturbance of ACM. This notification program is based on federal EPA and OSHA requirements.

During abatement work, notification to building occupants, as necessary and/or required, and other affected individuals, including outside contractors, can be accomplished several ways. Two common methods are:

- Distributing notices/letters, or
- Holding awareness or informational seminars.

The distribution of notices is an effective means of alerting employees about the presence of asbestos. Memos or letters can be tailored to specific parties, and verification that notification was received is easily accomplished.

4.7.4 Contractor Notification

The PPM is responsible to ensure that all outside contractors who may work at the subject site are properly informed in writing using the Contractor Notification letter (Appendix C) designed by CNS Management. For all emergency project work the superintendent or the Account Executive will notify CNS Management.

4.8 Labeling And Signs

As required by the regulations, The PPM will inform employees about the presence of ACM by distributing written notices, by posting signs or labels in a visible location where staff can see them.

In order to inform Maintenance, Custodial, and other personnel of potential asbestos hazards, asbestos labeling and/or signage may be necessary at the mechanical equipment rooms, HVAC rooms or other areas accessed by the staff. If easily damaged ACM are present in maintenance areas of the Property, labels will be affixed directly to the ACM or warning signs will be posted. Easily damaged ACM include thermal system insulation (TSI) materials, surfacing material, or any other friable materials.

If ACM labeling is conducted, then labels shall be affixed to all friable ACM within each mechanical or other building area that is not accessible to the public, but is accessible to maintenance, custodial, or contracted personnel.

If signage is implemented at the subject site, in addition to or in-place of localized labeling, warning signs will be posted at the entrance to mechanical rooms/areas in which employees reasonably can be expected to enter and which contain thermal system insulation material, surfacing ACM, or other friable ACM(s). This includes each mechanical or other building area that is not accessible to the public, but is accessible to maintenance, custodial, or contracted personnel. The PPM shall post signs that identify the ACM which is/are present; its/their location, and appropriate work practices which, if followed, will ensure that ACM will not be disturbed.

If required by applicable laws or regulations, The PPM will institute a labeling system to identify ACM. These labels will be prominently displayed and remain posted until ACM are removed. This labeling will serve to alert and remind building staff and outside contractors of the presence of the ACM and to avoid inadvertently disturbing the ACM.

The warning label print will be readily visible, in large letter size, or a bright color. The label will read as follows:

CAUTION
ASBESTOS
CANCER AND LUNG DISEASE HAZARD
DO NOT DISTURB WITHOUT
PROPER TRAINING AND EQUIPMENT

Warning signs will also be posted in areas where the airborne fiber concentrations can be reasonably expected to exceed the OSHA PEL of 0.1 f/cc. They serve to prevent unprotected individuals from entering those areas. The warning signs will read as follows:

DANGER
ASBESTOS
CANCER AND LUNG DISEASE HAZARD
AUTHORIZED PERSONNEL ONLY
RESPIRATORS AND PROTECTIVE
CLOTHING
ARE REQUIRED IN THIS AREA

During removal and repair operations warning signs will be affixed to barriers to warn any bystanders of the potential danger in the area. The signs will read as follows:

POTENTIAL ASBESTOS
HAZARD AREA
DO NOT ENTER

During asbestos remediation performed by trained personnel, the contractor shall be responsible for posting signs as required by OSHA regulations. CNS Management will be available to provide contractor assistance.

4.8.1 Asbestos Sampling and Analysis

Two types of asbestos measurements are required based on specific conditions as part of the O&M Program:

- Bulk samples, Polarized Light Microscopy (PLM), Method 40 CFR 763, Subpart F, Appendix A and EPA Method 600/M-82-020 to determine if asbestos is present; and transmission electron microscopy ("TEM") analysis following the procedures outlined in EPA Method 600/R-93/116.
- Air monitoring, Phase Contrast Microscopy (PCM), NIOSH Method 7-800, to determine airborne fiber and asbestos fiber concentrations.

Bulk Sampling

Assessments may be necessary to clarify, update, or identify ACM in the property.

Before maintenance, renovation, or contractor work is performed in any area, a licensed consultant must be notified to determine if ACM are present. Results from the bulk material sampling assessment will be maintained and will be distributed to appropriate divisional executives and/or associates, as necessary and in accordance with applicable federal, state, and local regulations.

Clearance Sampling

This sampling is used to determine if an area meets the regulatory criteria for clearance after a response action, renovation, or remodeling has been completed.

4.9 Asbestos Containing Waste Material Storage and Transportation

Asbestos-containing waste materials generated during O&M procedures will be stored and transported as follows:

- In leak-tight containers with the following warning labels.

DANGER

**CONTAINS ASBESTOS FIBERS
AVOID CREATING DUST
CANCER AND LUNG DISEASE HAZARD**

- Waste will be labeled with the name and location of the property where the waste was generated, and the initial accumulation date.
- Waste will not be stored in the properties longer than 2 days from initial accumulation. These containers will be temporarily stored on the premises in a secured container or storage area, for example, a trash can with a locking top or behind a locked cage or closet.
- All waste must be stored wet.
- A licensed asbestos waste hauler shall transport all waste. A copy of this license issued by the state agency will be retained in the permanent files.
- The waste hauling vehicle will be enclosed.
- An ACM waste shipment record must accompany all waste materials transported to the USEPA-approved landfill.
- The completed waste shipment record must be received from the disposal site within 35 days of the date the waste was accepted by the initial waste hauler. If it is not received within this timeframe, the PPM must contact the transporter or the operator of the landfill to determine the status of the waste shipment record.
- If the completed waste shipment record is not received within 45 days, a report must be submitted to the local USEPA Regional Office responsible for administering NESHAPs regulations.

4.10 Record Keeping

The PPM will maintain all records associated with a fiber release episode, including asbestos abatement contractor submittals (medical information, waste shipment records, etc.), Independent Asbestos Consultant's reports (air sampling data), and a fiber release episode report. The PPM will retain all records related to the O&M Program, such as:

- The written O&M Program itself, including work practices;
- Plans and drawings;
- Assessment data (location of ACM);
- Copies of notification and warning programs;
- Description of times, dates, attendees of training programs, and all outlines and written materials disseminated;
- Copies of all permits and documentation of maintenance, renovation, and emergency response actions performed;

- Periodic ACM surveillance records, including all air sampling data and photographs;
- Bulk and air sampling reports;
- Chain of custody for laboratory samples;
- Contractor insurance forms; and
- Waste disposal permits and waste shipment records.

The Account Executive or PPM shall maintain all records associated with asbestos-related activities (for example, testing and medical records) for a period of at least 30 years.

5.0 WORK PRACTICES

5.1 Areas with Friable ACM

Friable ACM has been identified within the Subject site. Friable asbestos containing pipe insulation and spray applied fireproofing were identified within first floor.

5.2 Areas with Non-Friable ACM

Non-friable PACM (for example, roofing, tar and roofing tower fill) typically release fibers only when severely damaged or disturbed. Fiber releases can occur when workers drill, cut, abrade, break, or saw vinyl asbestos floor tile or any other non-friable material. General cleaning and maintenance, however, will not damage the material. USEPA has instituted recommended guidelines when stripping wax or finish coat from asbestos-containing flooring, which must be followed by the building staff. Non-friable ACM floor tiles on the first and second floor offices, and built-up roofing, duct and wall tar and roofing tower fill were identified on the roof.

5.3 Common Maintenance Activities Impacting ACM

Maintenance activities performed at the subject site, which may impact, suspect or confirmed ACM are listed below. This work must be performed by taking the proper care and precautions, so as to not disturb the ACM.

Examples of Maintenance Activities Which May Potentially Impact ACM (Hence, all precautions must be taken so as not to disturb ACM while conducting these activities.)

- Maintaining Thermal Pipeline System; Repairing Leaking Fittings
- Removal of Overlay Carpeting; Buffing
- Sanding, or Grinding Floor Tiles
- Elevator Riser Repair or Maintenance
- Accessing Columns or Walls; Repairing Light Fixtures
- Access to Above Suspended Ceilings
- Changing Fluorescent Light Bulbs

Type of Material Being Potentially Impacted (Disturbance of these materials will be avoided while conducting work.)

- Pipe Fitting Insulation
- Floor Tile and Mastic

As required by applicable Federal, State and/or local laws and regulations, The PPM will inform employees about the location and physical condition of ACM that may be disturbed.

5.4 Recommended Guidelines for Stripping Wax or Finish from Asbestos Containing Flooring

1. AVOID STRIPPING FLOORS. Stripping of floors will be done as infrequently as possible, perhaps once or twice a year or less, depending on circumstances. The frequency will be carefully considered when floor maintenance schedules or contracts are written or renewed.
2. PROPERLY TRAIN STAFF. Custodial or building staff that strips floors will be trained to operate the machines and pads and use floor care chemicals properly and safely.

3. FOLLOW APPROPRIATE WORK PRACTICES. Custodial or building staff that strip floors will follow appropriate work practices, such as those recommended here, under informed supervision. Directions from floor tile and floor wax product manufacturers on proper maintenance procedures will be consulted.
4. STRIP FLOORS WHILE WET. The floor will be kept adequately wet during the stripping operations. DO NOT perform dry stripping. Prior to machine operation, an emulsion of chemical stripper in water is commonly applied to the floor with a mop to soften the wax or finish coat. After stripping and before application of the new wax, the floor will be thoroughly cleaned while wet.
5. RUN MACHINE AT SLOW SPEED. If the machine used to remove the wax or finish coat has variable speeds, it will be run at slow speed (about 175-190 rpm) during the stripping operations.
6. SELECT THE LEAST ABRASIVE PAD POSSIBLE. USEPA recommends that the machine be equipped with the least abrasive pad possible to strip wax or finish coat from asbestos-containing floors.

DO NOT STRIP FLOORS. Stop stripping when the old surface coat is removed. Over-stripping can damage the floor and may cause the release of asbestos fibers. DO NOT operate a floor machine with an abrasive pad on unwaxed or unfinished floors.

REMEMBER: Improperly removing asbestos-containing floor coverings could result in the release of asbestos fibers. USEPA recommends that you leave asbestos-containing floor covering in place, provided the material is in good condition. However, proper maintenance procedures, such as those previously outlined, will always be followed.

5.5 Cleaning

Cleaning up within specific areas of the property is one of the primary objectives of the O&M Program. The PPM will retain a licensed asbestos abatement contractor (i.e., pre-qualified), approved by CNS Management to conduct initial cleaning in areas of the property where damaged friable ACM are present as soon as the O&M Program is in place and before the initiation of any response action.

In areas of the property where damaged asbestos-containing thermal system insulation or surfacing material is present (i.e., an episodic event), The PPM will retain a pre-qualified licensed asbestos abatement contractor, approved by the CNS Management, to clean all areas in the immediate vicinity. All cleaning activities are to be recorded and included in the O&M annual.

Subsequent minor repair and routine maintenance will also be conducted by a pre-qualified and licensed asbestos abatement contractor.

INITIAL CLEANING

When damaged friable ACM is present the asbestos abatement contractor must HEPA vacuum and, if possible, wet clean all areas in the immediate vicinity. This includes cleaning all surfaces, such as shelves, walls, light fixtures, equipment housing, and exterior of ducts, with damp cloths or a HEPA vacuum.

All mop heads, damp cloths, liquid wastes, debris, filters, or vacuum bags must be disposed as asbestos-contaminated waste.

PERIODIC CLEANING

The determination of when/where periodic cleaning is needed is based on the rate of dust buildup. This determination will be made as part of the periodic inspection. If cleaning is necessary, a pre-qualified licensed asbestos abatement contractor will clean the areas.

The abatement contractor shall remove any debris found near friable damaged ACM using HEPA vacuum or wet methods. The contractor shall HEPA vacuum or steam clean all carpets in rooms with damaged ACM and wet wipe all surfaces in the area. If steam cleaning is used, the liquid waste generated during the process must be disposed as asbestos-contaminated waste. The contractor must dispose of debris, filters, and/or vacuum bags as asbestos-contaminated waste.

5.6 Work Practices for Maintenance Activities

Before conducting any maintenance or repair work that will potentially damage or disturb ACM, the PPM staff inspect the area to determine appropriate action(s). Whenever the potential for release of asbestos fibers from ACM exists (for example, sanding floor tile, repairing a pipe leak, or working above a suspended ceiling), a certified asbestos abatement contractor in a minimum, will perform all appropriate tasks to mitigate the potential for fiber releases associated with a maintenance activity or will directly perform the work procedures.

Basic O&M procedures to minimize and/or contain asbestos fibers may include wet methods, use of mini-enclosures, use of portable power tools equipped with special local ventilation attachments, and avoidance of certain activities, such as sawing, sanding, and drilling ACM.

NOTE: During O&M procedures, the Contractor must perform personal air monitoring. All asbestos waste generated during these activities must be handled in accordance with all local, state, and federal requirements and Section 4.9 herein.

Maintenance activities can be divided into three categories with regard to their potential for disturbing ACM:

CONTACT WITH ACM UNLIKELY - IN-HOUSE SUPERINTENDENTS

Maintenance activities or repairs, which can be performed without contacting or disturbing the ACM, require a little more than normal care and good workmanship and can be performed by in-house personnel. These include, but are not limited to:

- Repairing non-ACM insulated pipes or valves without disturbing other ACM.
- Routine cleaning activities.

All surfaces will be isolated to remove any settled fibers in the event that ACM are disturbed. An asbestos abatement contractor will respond to the asbestos fiber release episode.

CONTACT WITH ACM NOT LIKELY BUT POSSIBLE

Maintenance activities or repairs that may have the potential to cause accidental disturbance of ACM require some precautions. This work may be performed by superintendents only if the proper precautions are instituted to minimize the potential ACM disturbance. For example, local isolation may be needed if the chance of disturbance is likely. Activities that fall into this category include, but are not limited to:

- Working on a fixture near thermal system ACM;
- Working on a fixture above suspended ceilings where asbestos-containing sprayed-on fireproofing or troweled-on acoustical material is present;
- Installation of telecommunication or electrical conduits above suspended ceiling; and
- Repairing of a pipe that is not insulated with ACM but will disturb ACM on nearby pipes.

PLEASE NOTE: Any pre-cleaning or isolation work required to mitigate the potential of ACM disturbance that WILL IMPACT ASBESTOS shall be performed by a certified abatement contractor (i.e. cleaning contaminated ceiling tile or a major repair of thermal insulating ACM).

CONTACT WITH ACM LIKELY OR INTENDED - ONLY BY OUTSIDE ASBESTOS CONTRACTOR

Maintenance activities or repairs that involve intentional small-scale manipulation or disturbance of ACM require special work practices, as outlined in this O&M manual. ACM must be removed by a pre-qualified outside abatement contractor before in-house personnel perform their duties. Personal protective equipment, including respirators and Tyvek suits, and personal air monitoring are required when ACM will be disturbed.

Typical activities include but are not limited to:

- Removing a small segment of thermal system insulation to repair a pipe leak or replace a valve; and
- Removing a small amount of surfacing ACM to install new conduits or pipe braces.

Prior to performing any maintenance activities that will disturb ACM, the PPM shall contact an Independent Asbestos Consultant to provide area air monitoring before, during, and after the ACM disturbance, if necessary.

NOTE: Under no circumstances will any in-house employee perform this type of small-scale work or any other abatement work. Failure to adhere to this policy will be subject to disciplinary actions.

5.7 Special Work Practices for Planned Renovation Work

Future renovations may involve disturbing ACM or PACM and may also uncover building elements previously hidden that may contain asbestos. Work, such as moving walls, adding wings, and replacing heating or air-conditioning systems may involve breaking, cutting, or otherwise disturbing ACM.

All parties must be aware of potential ACM disturbance early in the project planning stage to determine appropriate actions. Partial or full removal may be necessary before renovation.

CNS Management shall develop guideline specifications or work plans in accordance with USEPA, OSHA, state, and local regulations, if necessary, for use by the asbestos abatement contractor.

CNS Management shall ensure that the asbestos abatement contractor perform all work in compliance with applicable federal, state, and local laws and regulations. CNS Management will assist in maintaining records of work, including copies of the specifications and closeout documentation provided by the Independent Consultant.

6.0 ASBESTOS REGULATIONS

To date, two federal agencies have been principally responsible for generating asbestos control regulations. These two agencies are the U.S. Environmental Protection Agency (EPA) and the Occupational Safety and Health Administration (OSHA). In general, OSHA extends to all private-sector employers and employees under federal jurisdiction. USEPA extends to all public and private work settings under federal jurisdiction. In addition, individual states and local townships have promulgated their own regulations. The following sections highlight some of these federal and state requirements.

The Construction Industry Standard covers employees engaged in demolition and construction and the following related activities likely to involve asbestos exposure: removal, encapsulation, alteration, repair, maintenance, insulation, spill/emergency cleanup, transportation, disposal, and storage of ACM. The General Industry Standard covers all other operations where exposure to asbestos is possible, including occupant exposure to asbestos from buildings that contain ACM. In general, O&M asbestos-related work are covered by the Construction Standard.

OSHA published its final rule on asbestos in the Federal Register on August 10, 1994. The new regulations amend the general industry (1910) and construction (1926) standards issued in 1986 and add a shipyard employment standard (1915). Highlights of the general industry and construction standards follow.

To enforce its standards, OSHA is authorized to conduct workplace inspections. In addition, employees have the right to file an OSHA complaint without fear of punishment from the employer. In turn, employees have the responsibility to follow all safety and health rules. OSHA may not conduct a warrantless inspection without the employer's consent.

OSHA will issue a citation during an inspection if the compliance officer finds a standard is violated. The citation informs the employer and employees of the regulations or standard(s) alleged to have been violated and of the proposed length of time for correction. Monetary penalties may also be imposed.

The permissible exposure limit (PEL) for airborne asbestos fiber concentrations has been lowered to 0.1 fiber per cubic centimeter (f/cc) as an 8-hour time-weighted average (TWA) for all asbestos work in all industries, effective October 11, 1994. There is no action level. The excursion limit remains at 1.0 f/cc, averaged over a 30-minute sampling period.

The general industry standard regulates all activities related to asbestos, except agricultural, that are not covered by the construction and shipyard employment standards. Under this standard, employers must provide awareness training to employees who perform housekeeping activities in areas where ACM or PACM are located. They must also institute a training program for all employees who are exposed to airborne asbestos at or above the PEL, and/or excursion limit and ensure that they participate in the program. The program will be presented before the initial assignment and at least annually thereafter.

OSHA has eliminated the term "small-scale short duration projects" in the construction standard. Instead OSHA classifies construction activity according to descending degree of risk. Class I work presents the greatest risk potential and Class IV, the lowest.

- Class I work involves the removal of thermal system insulation and surfacing ACM or PACM.
- Class II work involves removal of any other ACM which is not thermal system insulation or surfacing ACM.
- Class III work is defined as repair and maintenance activities where employees are likely to disturb ACM.
- Class IV is defined as maintenance and custodial activities during which employees contact ACM and PACM and activities to clean up waste and debris containing ACM and PACM.

Under the construction standard, employers must designate a "competent person" (for example, the Asbestos Consultant) who has the qualifications and authority for ensuring worker health and safety. This person must be capable of identifying existing asbestos hazards in the workplace and selecting the appropriate control strategy to reduce asbestos exposure and have the authority to take prompt corrective action. For Class I and II work, the competent person must be trained in accordance with EPA's Model Accreditation Plan (40 CFR 763) for project designer or supervisor, or its equivalent and, for Class III and IV work, must have completed training equivalent to the 16-hour O&M course developed by EPA for maintenance and custodial workers who conduct activities that will result in the disturbance of ACM. If duties are limited to activities such as changing of gaskets, a course of lesser duration may be sufficient. An annual refresher course of four hours is also required.

The competent person must be present on all construction worksites to supervise all asbestos work performed in regulated areas (an area where Class I, II, or III asbestos work is conducted, an adjoining area where debris and waste from the project may accumulate, and an area where airborne asbestos fiber concentrations exceed or have the potential to exceed the PEL), conduct frequent and regular inspections of the job sites, materials, and equipment as part of required safety and health program.

Employers must institute a training program for all workers who install asbestos-containing products and all workers who perform Class I, II, III, and IV work. Medical surveillance is required for all asbestos workers (for example, outside contractors) who engage in Class I, II, or III work for a combined total of 30 days or more a year or who are exposed above the PEL or the excursion limit of 1.0 f/cc.

Employers must communicate the hazards of asbestos to employees if ACM or PACM is present in their properties or if their employees will work with ACM.

Regulations relate to worker/supervisor training, laboratory accreditation, consulting practices (inspector, monitor, designers, and air samplers), training providers, and allied trades. Part 73 of the OSHA regulation also deals with training of O&M personnel and other Building staff.

Clearance sampling is done using NIOSH 7400 Method (PCM) using 0.01 fibers per cubic centimeter or pre-established background fiber level as clearance level. Transmission Electron Microscopy (TEM) is optional.

The New York City Department of Environmental Protection and the New York State Department of Labor require 10 days pre-project notification for all projects of regulated areas.

All records associated with asbestos work shall be maintained for 30 years.

6.1 National Emission Standards for Hazardous Air Pollutants (NESHAP)

The USEPA National Emission Standards for Hazardous Air Pollutants (NESHAP, 40 CFR Part 61, Subpart M, as amended November 20, 1990) will be considered during any maintenance, renovation, or demolition activities that might disturb ACM. NESHAP's rules apply to the application, removal, and disposal of ACM. Also included in NESHAP are rules concerning manufacturing, spraying, and fabricating ACM. Some highlights of the NESHAP requirements follow.

NESHAP ACM CATEGORIES

NESHAP, as amended November 20, 1990 divides types of ACM into three categories: regulated ACMs (RACM), Category I non-friable ACM, and Category II non-friable ACM.

Regulated Asbestos-Containing Materials (RACM)

RACM are friable ACM that contain more than 1 percent asbestos that, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure.

Category I Non-Friable ACM

Category I non-friable ACM include asbestos gaskets, resilient floor coverings, and asphalt roofing products containing more than 1 percent asbestos that cannot be crumbled, pulverized, or reduced to powder by hand pressure.

Category I non-friable ACM that have been made friable or subjected to sanding, grinding, cutting, or abrading are considered to be RACM.

Category II Non-Friable ACM

Category II non-friable ACM include all other forms of non-friable ACM, containing more than 1 percent asbestos that are not included in Category I. Examples include Transite board such as asbestos cement siding.

Category II non-friable ACM that will be or have a high probability of becoming crumbled, pulverized, or reduced to powder are also considered to be RACM.

INSPECTIONS

Inspection is required to identify all forms of asbestos present in a property prior to renovation or demolition activities. These include RACM and Category I and II non-friable ACM.

NESHAP defines demolition as the removal of a load supporting structural member of a property or intentional burning.

NOTIFICATIONS

Notification must be given to the regional EPA Region 2 coordinator and the New York City Department of Environmental Protection and New York State Department of Labor 10 working days prior to demolition of a building regardless of the quantity of RACM present.

Notification must also be provided 10 working days prior to demolition for any property that does contain asbestos.

RENOVATION PROJECTS

NESHAP defines renovation as altering a property or component in any way, including removal of ACM.

Notification must be given 10 working days prior to renovation if quantities greater than 160 square feet or 260 linear feet of RACM are removed.

Notification must be provided at least 10 working days before the end of the preceding calendar year if the combined additive amount of friable RACM to be removed or stripped during planned renovations in the next calendar year is greater than 260 linear feet or 160 square feet.

REMOVAL REQUIREMENTS

Removal prior to renovation/demolition is required of any RACM that will be affected by such renovation or demolition. Prior to renovation, if the activities would "break up or disturb" RACM, removal may be the only practical alternative.

Friable RACM must be removed using wet removal techniques.

With special approval from USEPA, dry removal is allowed under certain circumstances.

No visible emissions to the outside air are permitted during removal or renovation.

DISPOSAL REQUIREMENTS

No visible emissions to the outside air are allowed during collecting, packaging, transporting, or depositing ACM waste.

Wet ACM must be sealed in leak-tight containers.

Containers must be labeled with OSHA labels and provide the generator's identification and property location. A generator's number for hazardous waste is not required.

6.2 Other Federal Agencies

Other federal agencies promulgating asbestos regulations include the Department of Transportation (DOT) on the transport of asbestos and the National Bureau of Standards on standards and protocols for laboratory accreditation.

6.3 State And Local Agencies

The state and local agencies may have additional requirements to those of federal agencies. Therefore, state and local regulations where the property is located must be reviewed and complied. Some of the state and local agencies include, the New York City Department of Environmental Protection and the New York State Department of Labor.

6.4 New York City & New York State Regulatory Requirements

New York City – Title 15 Chapter 1 of the Rules and Regulations of the City of New York.

New York State – New York State Department of Labor Industrial Code Rule 56.

7.0 HISTORY

Asbestos has been determined to be a naturally occurring carcinogen once used in a wide variety of building products. Asbestos-containing materials ("ACM") remain in buildings and exist in certain properties managed by The PPM. The presence of ACM within a building does not, in and of itself, pose a hazard to human health. This program is designed to control the possible health risks, which could be created if excessive asbestos fibers are released.

A naturally occurring mineral, asbestos is a fibrous hydrated silicate which possesses the unique characteristics of high tensile strength, flexibility, and chemical, electrical, and thermal resistance, and yet, is relatively inexpensive. As a consequence of these properties, the commercial use of asbestos has been exceedingly widespread and is found in products ranging from cosmetics to insulation.

The earliest recorded use of asbestos was about 2500 B.C. in Finland where the mineral was used to strengthen clay pots. More recently though, modern industrial exploitation of this silicate dates from the 1880's when it was mined in Canada and the U.S.S.R. The use of asbestos rapidly increased in England and France where the fibers were incorporated into cotton fabrics, thereby producing incombustible fabrics. However, the real growth, especially in the West, has been in the past 40 years, since the Second World War. Asbestos is still used in many products today.

There are six asbestos minerals which are used in over 1,000 commercial applications. The six asbestos minerals are as follows:

Serpentines- These asbestos minerals have a sheet or layered crystalline structure.

- **Chrysotile**, the only mineral in the serpentine group, is the most commonly used type of asbestos and accounts for approximately 95% of the asbestos found in buildings in the United States. Chrysotile is commonly known as "white asbestos", so named for its natural color.

Amphiboles- These asbestos minerals have a chain-like crystalline structure.

- **Amosite**, the second most likely type of asbestos mineral to be found in buildings, is often referred to as "brown asbestos", also due to its natural color.

- **Crocidolite**, "blue asbestos", was utilized in high temperature insulation applications.

■

Anthophyllite, tremolite, and Actinolite, are extremely rare, and of little commercial value. Occasionally, they are found as contaminants in ACMs.

8.0 POTENTIAL HEALTH CONCERNS

8.1 Exposure Potential

Construction materials containing friable asbestos have been used extensively in commercial buildings, especially those built prior to 1975, although it has been found in buildings constructed in the early 1980's. Some non-friable materials (for example, floor tile, mastic, and joint compounds) have been known to be contained in buildings constructed after 1980. The concern about exposure to asbestos in these buildings is based on evidence linking various respiratory diseases with intensive occupational exposure to asbestos, primarily in the shipbuilding, mining, milling, and fabricating industries.

After performing numerous assessments of asbestos fiber levels in air, the USEPA found that average asbestos levels inside buildings are essentially the same as levels outside buildings. USEPA determined that intact, undisturbed, asbestos materials do not pose a health risk and that the mere presence of asbestos in a building does not mean that the health of the building occupants is endangered.

The presence of asbestos in a building does not mean that the occupants are at risk. If ACM remain in good condition and are unlikely to be disturbed, exposure will be negligible. However, when ACM are damaged or disturbed (for example, by maintenance, repairs, or renovations conducted without proper controls), asbestos fibers can be released.

Friable ACM (those which can be crumbled, pulverized, or reduced to powder by hand pressure) present a potential source of exposure and must be carefully protected from damage or disturbance. In materials where asbestos fibers are firmly encased in a solid matrix, such as cement asbestos pipe or vinyl asbestos floor tile, there is a reduced possibility of airborne asbestos fiber exposures, except during cutting, demolition, drilling, grinding, and sanding.

Risks associated with low level, non-occupational exposure have not been well defined. As a result, USEPA has instituted measures for schools to control or eliminate exposures (AHERA regulation).

The AHERA regulation is considered "state-of-the-art" for asbestos control and is often used as a guideline by private industry. This O&M Program generally follows the guidelines issued by the AHERA regulation since they are important in limiting employee risk of asbestos exposure.

8.2 Potential Health Effects

The potential adverse health concerns associated with asbestos exposure have been extensively studied for many years. Results of these studies and epidemiological investigations have demonstrated that extensive and intensive inhalation of asbestos fibers may lead to increased risk of developing one or more diseases.

It is important to recognize that most people who have developed a disease as a result of asbestos exposure were asbestos workers (for example, miners, factory workers, and ship builders). These workers were frequently exposed to very high concentrations of asbestos fibers each working day with little or no protection.

Ambient levels in buildings today are typically tens of thousands times lower than those measured in the past during mining, milling, and ship building activities (USEPA, 1990). Additionally, today's workers follow specific work practices and wear appropriate personal protection, including respirators, to minimize the risk of exposure.

THE RESPIRATORY SYSTEM

The primary health concerns of asbestos are due to excessive inhalation of high concentrations of asbestos fibers. As air is breathed in, it passes through the mouth and nose into the windpipe or trachea. The trachea splits into two smaller airways called the bronchi. Each bronchus divides into smaller and smaller tubes which lead into air sacks. These air sacks are called alveoli. In these air sacks (alveoli), oxygen passes through the alveoli membrane and is absorbed into small blood vessels. Carbon dioxide and other waste gases pass out of the blood back into the alveoli where they are exhaled.

The lung is comprised of two lobes and sits in the pleural cavity. The lining of the cavity and the membranes around the lung are in contact with each other and are very moist. Like two panes of glass with a drop of water between them, these membranes slide easily across each other, but are very difficult to pull apart. Thus, as the chest cavity expands, the lungs do too, and air rushes in. If these linings (mesothelium) became damaged, one would not be able to inhale properly.

The body has several mechanisms by which it "filters" the air breathed. First, very large particles are removed in the nose and mouth. Smaller particles are caught on the mucous-coated walls of the airways. These airways have a hair-like lining (ciliated cells) which constantly beats upward. The ciliated cells sweep the particles up the airway and into the mouth where particles are either swallowed or expelled. Particles caught in the mucous are swept into the back of the mouth.

Cigarette smoking temporarily paralyzes these ciliated cells, inhibiting one of the body's natural defenses against inhaled dust. As the smoker sleeps, the hairlike cells start working again and carry large amounts of mucous into the back of the mouth. This causes the so-called "smoker's hack" in the morning. After the first cigarette or two, the cleansing mechanism is paralyzed again and the coughing stops, allowing more particles to enter into the deeper airways and cause potential damage. For this reason, smokers who are exposed to asbestos appear to be at greater risk than nonsmokers.

Even with these natural defenses of the body, some dust particles inevitably reach the tiny air sacks. When this occurs, large cells (called macrophages) attempt to engulf the particle and "digest" it. For this reason, they are sometimes called the "lungs' garbage collector". However, because asbestos is a mineral fiber, the macrophages are sometimes unsuccessful. In a secondary defense mechanism, these macrophages deposit a coating on the fibers when they are unsuccessful in digesting them. This occurrence causes a series of chain reactions that ultimately result in the development of scar tissue on the lung. Where the presence of scar tissue disrupts normal respiratory function, asbestosis may develop.

ASBESTOSIS

Asbestosis is a disease characterized by fibrotic scarring of the lung. It is a restrictive disease that reduces the capacity of the lung and hampers its ability to exchange gases. The earliest symptom is coughing. Asbestosis is prevalent among workers who have been exposed to large doses of asbestos fibers over a long period of time. There is a clear dose-response relationship between asbestos exposure and development of this disease. This means that the greater the asbestos exposure, the more likely asbestosis will develop.

Asbestosis is irreversible and can progress even after exposure has ceased. As the disease progresses, shortness of breath is commonly observed along with changes in lung function, a crackling sound in the lower half of the lung, and clubbed fingers.

Although most people believe a threshold exposure level exists below which the disease does not occur, this threshold level has not yet been determined. All forms of asbestos have demonstrated the ability to cause asbestosis. Like all diseases associated with asbestos exposure, it may take many years for the disease to develop. The typical time of symptoms of diseases to appear from the time of the exposure (latency period) for asbestosis is 15 to 30 years.

LUNG CANCER

There are many causes of lung cancer, of which asbestos is only one. While employees exposed to industrial concentrations of asbestos in years past have an increased risk of getting lung cancer five times the normal population, their risk is not as great as the cigarette smoker whose risk is ten times the normal. A cigarette smoker who also works with asbestos is 50 times more likely to contract lung cancer than the normal nonsmoking population. The cigarette smoking and asbestos exposure multiply the effects of each other. This is known as a synergistic effect" (Safirkeff Studies, 1979).

Like asbestosis, there exists a long lag time between initial exposure and the occurrence of lung cancer which is typically 20 to 30 years. There appears to be a dose-response relationship between asbestos exposure and lung cancer although no "safe" lower exposure level has yet been determined. Again, these figures relate to past industrial situations where workers wore little or no personal protective equipment.

MESOTHELIOMA

The asbestos-associated disease of greatest concern in asbestos work is probably mesothelioma, it is also the rarest. It is considered to be a marker disease for asbestos exposure. Mesothelioma is a cancer of the chest or abdominal cavity linings (mesothelium). If it occurs in the chest cavity, it is called pleural mesothelioma. If it occurs in the abdominal cavity, it is called peritoneal mesothelioma. By the time either cancer is diagnosed, it is almost always fatal and effective therapy does not currently exist.

There is no exposure threshold for mesothelioma. The exact mechanism of the disease remains unknown. Smokers do not appear to be at greater risk of getting mesothelioma nor does a dose-response relationship seem to exist between asbestos exposure and mesothelioma. Like other diseases caused by asbestos exposure, mesothelioma often takes 30-40 years after initial exposure to develop.

OTHER DISEASES

Other diseases and adverse health effects have been observed in conjunction with asbestos exposure. Increased incidence of gastrointestinal cancers, including cancers of the esophagus, stomach, colon-rectum, kidney, and pancreas have been observed in populations exposed to asbestos.

Pleural plaque (thickening of the chest cavity lining) has also been observed among people exposed to asbestos. This condition does not have any symptoms nor does it require treatment.

APPENDIX A

EXAMPLE OF NOTIFICATION LETTER TO TENANTS

ASBESTOS NOTICE TO TENANTS OF:

Property Name: _____

Tenant: _____

In response to an environmental assessment that identified Asbestos-Containing Materials (ACM) and/or Presumed Asbestos-Containing Materials (PACM) at the building, we have implemented a written Asbestos Operations and Maintenance (O&M) Program. This Program is designed to maintain all asbestos in the building in good condition and prevent conditions that could cause exposure to tenants and employees. Asbestos only presents a health hazard when fibers become airborne and are inhaled. The mere presence of ACM does not represent a health hazard. All ACM is inspected periodically and additional measures will be taken if needed to protect the health of building occupants. Cleaning and building staff are taking special precautions during their work to properly clean up any asbestos debris and to guard against disturbing ACM.

In accordance with our O&M Program, this building has been inspected for friable (easily crumbled) and non-friable materials which contain asbestos. Friable and non-friable ACM and PACM that is present in the tenant occupied or common areas of the building include the following:

Material Description	Location
Friable Materials	
PACM Wallboard and joint compound wall and ceiling systems	These materials are installed at the Property in areas where wall and ceiling material replacements, repairs, or renovations have been conducted.
PACM Pipe straight-section insulation materials.	Where observed, asbestos-containing pipe insulation materials are replaced with non-asbestos-containing fiberglass. Nonetheless, sections of the original materials are still present exposed in isolated areas, and concealed within fixed walls, ceilings, or chases. In tenant accessible areas of the building, these materials are generally concealed within fixed walls, ceilings, or chases.
PACM Pipe flange, elbow, valve, joint insulation materials.	These materials are located throughout the Property. (See the above comments for pipe straight-section insulation materials.)
Non-Friable Materials	
PACM 12" x 12" and ACM 9" x 9" vinyl floor tiles, sheet resilient flooring materials (linoleum), and mastics and floor backing materials under these flooring materials	These materials are applied within some units. Multiple layers may also be present.
PACM Floor backing and mastics under parquet flooring	These materials are located throughout the Property.

Tenants will note that the inspection of these materials throughout the building by a licensed Asbestos Inspector did not identify any imminent tenant exposure conditions. The ACM identified in and around the tenant areas can be maintained in-place through the proper implementation of an O&M Program without threat of exposure to building occupants.

As part of the O&M Program, Acadia Realty Trust is taking steps to notify the below listed persons of the presence, location and quantity of ACM and PACM at the work sites in the building:

- Prospective employers applying or bidding for work whose employees reasonable can be expected to work in or adjacent to areas containing ACM/PACM.
- Employees of the owner who will work in or adjacent to areas containing ACM/PACM.
- All employers of employees who will be performing work within or adjacent to areas containing ACM/PACM.
- Employers of employees (commercial tenants) who will occupy areas containing ACM/PACM.

Also as part of the O&M Program, we ask that all building tenants participate in the following:

- Do not disturb ACM/PACM.
- Report any evidence of disturbance or damage of ACM/PACM to The Property Program Manager (PPM).
- Report any dust or debris that might come from the ACM or suspect ACM, any change in the condition of the ACM/PACM, or any improper action (relative to ACM/PACM) of building personnel to The PPM.
